# Asymptotic Normality in Density Support Estimation 

Gérard Biau*<br>Benoît Cadre ${ }^{\dagger}$<br>David M. Mason*<br>Bruno Pelletier ${ }^{\text {§ }}$

#### Abstract

Let $X_{1}, \ldots, X_{n}$ be $n$ independent observations drawn from a multivariate probability density $f$ with compact support $S_{f}$. This paper is devoted to the study of the estimator $\hat{S}_{n}$ of $S_{f}$ defined as the union of balls centered at the $X_{i}$ and with common radius $r_{n}$. Using tools from Riemannian geometry, and under mild assumptions on $f$ and the sequence $\left(r_{n}\right)$, we prove a central limit theorem for $\lambda\left(S_{n} \Delta S_{f}\right)$, where $\lambda$ denotes the Lebesgue measure on $\mathbb{R}^{d}$ and $\Delta$ the symmetric difference operation.

Key words: Support estimation, Nonparametric statistics, Central limit theorem, Tubular neighborhood.

## 1 Introduction

Let $X_{1}, \ldots, X_{n}$ be independent and identically distributed observations drawn from an unknown probability density $f$ defined on $\mathbb{R}^{d}$. It is assumed that $d \geq 2$ throughout this paper. We investigate the problem of estimating the support of $f$, i.e., the closed set

$$
S_{f}=\overline{\left\{x \in \mathbb{R}^{d}: f(x)>0\right\}},
$$

based on the sample $X_{1}, \ldots, X_{n}$. Here and elsewhere, $\bar{A}$ denotes the closure of a Borel set $A$. This problem is of interest due to the broad scope of its practical applications in applied statistics. These include medical diagnosis, machine condition monitoring, marketing and econometrics. For a review and a large list of references, we refer the reader to Molchanov (1998), Baillo, Cuevas, and Justel (2000), Biau, Cadre, and Pelletier (2008) and Mason and Polonik (2009).

Devroye and Wise (1980) introduced the following very simple and intuitive estimator of $S_{f}$. It is defined as

$$
\begin{equation*}
S_{n}=\bigcup_{i=1}^{n} \mathscr{B}\left(X_{i}, r_{n}\right) \tag{1.1}
\end{equation*}
$$

where $\mathscr{B}(x, r)$ denotes the closed Euclidean ball centered at $x$ and of radius $r>0$, and where ( $r_{n}$ ) is an appropriately chosen sequence of positive smoothing parameters. For $x \in \mathbb{R}^{d}$, let

$$
f_{n}(x)=\sum_{i=1}^{n} \mathbf{1}_{\mathscr{B}\left(x, r_{n}\right)}\left(X_{i}\right)
$$

be the (unnormalized) kernel density estimator of $f$. We see that

$$
S_{n}=\left\{x \in \mathbb{R}^{d}: f_{n}(x)>0\right\} .
$$

In other words, $S_{n}=S_{f_{n}}$, i.e., it is just a plug-in-type kernel estimator with kernel having a ball-shaped support. Baillo, Cuevas, and Justel (2000) argue that this estimator is a good generalist when no a priori information is available about $S_{f}$. Moreover, from a practical perspective, the relative simplicity of the estimation strategy (1.1) is a major advantage over competing multidimensional set estimation techniques, which are often faced with a heavy computational burden.

Biau, Cadre, and Pelletier (2008) proved, under mild regularity assumptions on $f$ and the sequence $\left(r_{n}\right)$, that for an explicit constant $c>0$,

$$
\sqrt{n r_{n}^{d}} \mathbb{E} \lambda\left(S_{n} \Delta S_{f}\right) \rightarrow c
$$

where $\Delta$ denotes the symmetric difference operation and $\lambda$ is the Lebesgue measure on $\mathbb{R}^{d}$. In the present paper, we go one step further and establish the asymptotic normality of $\lambda\left(S_{n} \Delta S_{f}\right)$. Precisely, our main Theorem 2.1 states, under appropriate regularity conditions on $f$ and $\left(r_{n}\right)$, that

$$
\left(\frac{n}{r_{n}^{d}}\right)^{1 / 4}\left(\lambda\left(S_{n} \Delta S_{f}\right)-\mathbb{E} \lambda\left(S_{n} \Delta S_{f}\right)\right) \xrightarrow{\mathscr{O}} \mathscr{N}\left(0, \sigma_{f}^{2}\right),
$$

for some explicit positive variance $\sigma_{f}^{2}$.
Denoting by $\partial S_{f}$ the boundary of $S_{f}$, it turns out that, under our conditions, $\lambda\left(\partial S_{f}\right)=0$ and $f>0$ on the interior of $S_{f}$. Therefore, we have the equality

$$
\lambda\left(S_{f} \triangle\left\{x \in \mathbb{R}^{d}: f(x)>0\right\}\right)=0 .
$$

Thus, $\lambda\left(S_{n} \Delta S_{f}\right)$ may be expressed more conveniently as

$$
\lambda\left(S_{n} \Delta S_{f}\right)=\int_{\mathbb{R}^{d}}\left|1\left\{f_{n}(x)>0\right\}-1\{f(x)>0\}\right| \mathrm{d} x .
$$

This quantity is related to the so-called vacancy $V_{n}$ left by randomly distributed spheres (see Hall 1985, 1988), which in this notation is

$$
\begin{equation*}
V_{n}=\lambda\left(S_{f}-S_{n}\right)=\int_{S_{f}}\left|\mathbf{1}\left\{f_{n}(x)>0\right\}-1\{f(x)>0\}\right| \mathrm{d} x \tag{1.2}
\end{equation*}
$$

Hall (1985) has proved a number of central limit theorems for $V_{n}$. One of them, his Theorem 1, states that if $f$ has support in $[0,1]^{d}$ and is continuous then, as long as $n r_{n}^{d} \rightarrow a$ where $0<a<\infty$, for some $0<\sigma_{a}^{2}<\infty$,

$$
\sqrt{n}\left(V_{n}-\mathbb{E} V_{n}\right) \xrightarrow{\mathscr{O}} \mathscr{N}\left(0, \sigma_{a}^{2}\right) .
$$

As pointed out in Hall's paper, and to the best of our knowledge, the case when $n r_{n}^{d} \rightarrow \infty$ has not been examined, except for some restricted cases in dimension 1. It turns out that, by adapting our arguments to the vacancy problem, we are also able to prove a general central limit theorem for $V_{n}$ when $n r_{n}^{d} \rightarrow \infty$, thereby extending Hall's results. For more about large sample properties of vacancy and their applications consult Chapter 3 of Hall (1988).

Another result closely related to ours is the following special case of the main theorem in Mason and Polonik (2009). For any $0<c<\sup \left\{f(x): x \in \mathbb{R}^{d}\right\}$, let $C(c)=\left\{x \in \mathbb{R}^{d}: f(x)>c\right\}$ and $\hat{C}_{n}(c)=\left\{x \in \mathbb{R}^{d}: \hat{f}_{n}(x)>c\right\}$, where $\hat{f}_{n}$ denotes a kernel estimator of $f$. Then

$$
\lambda\left(\hat{C}_{n}(c) \triangle C(c)\right)=\int_{\mathbb{R}^{d}}\left|\mathbf{1}\left\{\hat{f}_{n}(x)>c\right\}-\mathbf{1}\{f(x)>c\}\right| \mathrm{d} x .
$$

Mason and Polonik (2009) prove, subject to regularity conditions on $f$, as long as $\sqrt{n r_{n}^{d+2}} \rightarrow \gamma$, with $0 \leq \gamma<\infty$ and $n r_{n}^{d} / \log n \rightarrow \infty$, where $\gamma=0$ in the case $d=1$, that for some $0<\sigma_{c}^{2}<\infty$,

$$
\left(\frac{n}{r_{n}^{d}}\right)^{1 / 4}\left(\lambda\left(\hat{C}_{n}(c) \triangle C(c)\right)-\mathbb{E} \lambda\left(\hat{C}_{n}(c) \triangle C(c)\right)\right) \xrightarrow{\mathscr{B}} \mathscr{N}\left(0, \sigma_{c}^{2}\right) .
$$

The paper is organized as follows. In Section 2, we first set out notation and assumptions, and then state our main results. Section 3 is devoted to the proofs.

## 2 Asymptotic normality of $\lambda\left(S_{n} \Delta S_{f}\right)$

### 2.1 Notation and assumptions

Throughout the paper, we shall impose the following set of assumptions related to the support of $f$. To state some of them we shall require a few concepts and terms from Riemannian geometry. For a good introduction to the subject we refer the reader, for instance, to the book by Gallot, Hulin and Lafontaine (2004). We make use of the notation $\stackrel{\circ}{S}_{f}$ to denote the interior of $S_{f}$.

## Assumption Set 1

(a) The support $S_{f}$ of $f$ is compact in $\mathbb{R}^{d}$, with $d \geq 2$.
(b) $f$ is of class $\mathscr{C}^{1}$ on $\mathbb{R}^{d}$, and of class $\mathscr{C}^{2}$ on $\mathscr{T} \cap \stackrel{\circ}{S}_{f}$, where $\mathscr{T}$ is a tubular neighborhood of $S_{f}$.
(c) The boundary $\partial S_{f}$ of $S_{f}$ is a smooth submanifold of $\mathbb{R}^{d}$ of codimension 1.
(d) The set $\left\{x \in \mathbb{R}^{d}: f(x)>0\right\}$ is connected.
(e) $f>0$ on $\stackrel{\circ}{S}_{f}$.

Roughly speaking, under Assumption 1-(c), the boundary $\partial S_{f}$ is a subset of dimension $(d-1)$ of the ambient space $\mathbb{R}^{d}$. For instance, consider a density supported on the unit ball of $\mathbb{R}^{d}$. In this case, the boundary is the unit sphere of dimension $(d-1)$. Note also that one can relax Assumption 1-(d) to the case where the set $\left\{x \in \mathbb{R}^{d}: f(x)>0\right\}$ has multiple connected components, see Remark 3.3 in Biau, Cadre, and Pelletier (2008).

More precisely, under Assumption 1-(c), $\partial S_{f}$ is a smooth Riemannian submanifold with Riemannian metric, denoted by $\sigma$, induced by the canonical embedding of $\partial S_{f}$ in $\mathbb{R}^{d}$. The volume measure on ( $\partial S_{f}, \sigma$ ) will be denoted by $v_{\sigma}$. Furthermore, $\left(\partial S_{f}, \sigma\right)$ is compact and without boundary. Then by the tubular neighborhood theorem (see e.g., Gray, 1990; Bredon, 1993, p. 93), $\partial S_{f}$ admits a tubular neighborhood of radius $\rho>0$,

$$
\mathscr{V}\left(\partial S_{f}, \rho\right)=\left\{x \in \mathbb{R}^{d}: \operatorname{dist}\left(x, \partial S_{f}\right)<\rho\right\},
$$

i.e., each point $x \in \mathscr{V}\left(\partial S_{f}, \rho\right)$ projects uniquely onto $\partial S_{f}$. Let $\left\{e_{p} ; p \in \partial S_{f}\right\}$ be the unit-norm section of the normal bundle $T \partial S_{f}^{\perp}$ that is pointing inwards, i.e., for all $p \in \partial S_{f}, e_{p}$ is the unit normal vector to $\partial S_{f}$ directed towards the interior of $S_{f}$. Then each point $x \in \mathscr{V}\left(\partial S_{f}, \rho\right)$ may be expressed as

$$
\begin{equation*}
x=p+v e_{p}, \tag{2.1}
\end{equation*}
$$

where $p \in \partial S_{f}$, and where $v \in \mathbb{R}$ satisfies $|v| \leq \rho$. Moreover, given a Lebesgue integrable function $\varphi$ on $\mathscr{V}\left(\partial S_{f}, \rho\right)$, we may write

$$
\begin{equation*}
\int_{\mathscr{V}\left(\partial S_{f}, \rho\right)} \varphi(x) \mathrm{d} x=\int_{\partial S_{f}} \int_{-\rho}^{\rho} \varphi\left(p+v e_{p}\right) \Theta(p, u) \mathrm{d} u v_{\sigma}(\mathrm{d} p), \tag{2.2}
\end{equation*}
$$

where $\Theta$ is a $\mathscr{C}^{\infty}$ function satisfying $\Theta(p, 0)=1$ for all $p \in \partial S_{f}$. (See Appendix B in Biau, Cadre, and Pelletier, 2008.)

Denote by $D_{e_{p}}^{2}$ the directional differentiation operator of order 2 on $\mathscr{V}\left(\partial S_{f}, \rho\right)$ in the direction $e_{p}$. It will be seen in the proofs in Section 3 that the variance in our central limit theorem is determined by the second order behavior of $f$ near the boundary of its support. Therefore to derive this variance we shall need the following set of second order smoothness assumptions on $f$.

## Assumption Set 2

(a) There exists $\rho>0$ such that, for all $p \in \partial S_{f}$, the map $u \mapsto f\left(p+u e_{p}\right)$ is of class $\mathscr{C}^{2}$ on $[0, \rho]$.
(b) There exists $\rho>0$ such that

$$
0<\sup _{p \in \partial S_{f}} \sup _{0 \leq u \leq \rho} D_{e_{p}}^{2} f\left(p+u e_{p}\right)<\infty .
$$

(c) There exists $\rho>0$ such that

$$
\inf _{p \in \partial S_{f}} \inf _{0 \leq u \leq \rho} D_{e_{p}}^{2} f\left(p+u e_{p}\right)>0 .
$$

For similar smoothness assumptions see Section 2.4 of Mason and Polonik (2009). The imposition of such conditions appears to be unavoidable to derive a central limit theorem. Note also that Assumption Sets 1 and 2 are the same as the ones used in Biau, Cadre, and Pelletier (2008). In particular, we assume throughout that the density $f$ is continuous on $\mathbb{R}^{d}$. Thus, we are in the case of a non-sharp boundary, i.e., $f$ decreases continuously to zero at the boundary of its support. The case where $f$ has sharp boundary requires a different approach (see for example Härdle, Park, and Tsybakov, 1995). The analytical assumptions on $f$ (Assumption Set 2) are stipulations on the local behavior of $f$ at the boundary of the support. In particular, the restrictions on $f$ imply that inside the support and close to the boundary the maps $u \mapsto f\left(p+u e_{p}\right)$, with $p \in \partial S_{f}$, are strictly convex (see the Appendix).

### 2.2 Main result

Let

$$
\begin{equation*}
\sigma_{f}^{2}=2^{d} \int_{\partial S_{f}} \int_{0}^{\infty} \int_{\mathscr{B}(0,1)} \Phi(p, t, u) \mathrm{d} u \mathrm{~d} t v_{\sigma}(\mathrm{d} p), \tag{2.3}
\end{equation*}
$$

with

$$
\Phi(p, t, u)=\exp \left(-\omega_{d} D_{e_{p}}^{2} f(p) t^{2}\right)\left[\exp \left(\beta(u) D_{e_{p}}^{2} f(p) \frac{t^{2}}{2}\right)-1\right],
$$

$\omega_{d}$ denoting the volume of $\mathscr{B}(0,1)$ and

$$
\beta(u)=\lambda(\mathscr{B}(0,1) \cap \mathscr{B}(2 u, 1)) .
$$

Remark 2.1. Let $\Gamma$ be the Gamma function. We note that $\beta(u)$ has the closed expression (Hall, 1988, p. 23)

$$
\beta(u)= \begin{cases}\frac{2 \pi^{(d-1) / 2}}{\Gamma\left(\frac{1}{2}+\frac{d}{2}\right)} \int_{|u|}^{1}\left(1-y^{2}\right)^{(d-1) / 2} \mathrm{~d} y, & \text { if } 0 \leq|u| \leq 1 \\ 0, & \text { if }|u|>1,\end{cases}
$$

which, in particular, gives

$$
\beta(0)=\omega_{d}=\frac{\pi^{d / 2}}{\Gamma\left(1+\frac{d}{2}\right)} .
$$

We are now ready to state our main result.
Theorem 2.1. Suppose that both Assumption Sets 1 and 2 are satisfied. If (r.i) $r_{n} \rightarrow 0$, (r.ii) $n r_{n}^{d} /(\ln n)^{4 / 3} \rightarrow \infty$ and (r.iii) $n r_{n}^{d+1} \rightarrow 0$, then

$$
\left(\frac{n}{r_{n}^{d}}\right)^{1 / 4}\left(\lambda\left(S_{n} \Delta S_{f}\right)-\mathbb{E} \lambda\left(S_{n} \Delta S_{f}\right)\right) \xrightarrow{\mathscr{O}} \mathscr{N}\left(0, \sigma_{f}^{2}\right),
$$

where $\sigma_{f}^{2}>0$ is as in 2.3).
Remark 2.2. A referee pointed out that the methods in the paper may be applicable to obtain a central limit theorem for the histogram-based support estimator studied in Baillo and Cuevas (2006). The reference Cuevas, Fraiman, and Rodríguez-Casal (2007) should be a starting point for such an investigation.

It is known from Cuevas and Rodríguez-Casal (2004) that the choice $r_{n}=\mathrm{O}\left((\ln n / n)^{1 / d}\right)$ gives the fastest convergence rate of $S_{n}$ towards $S_{f}$ for the Hausdorff metric, that is $\mathrm{O}\left((\ln n / n)^{1 / d}\right)$. For such a radius choice, the concentration speed of $\lambda\left(S_{n} \Delta S_{f}\right)$ around its expectation as given by Theorem 2.1 is $\mathrm{O}\left(\sqrt{n} /(\ln n)^{1 / 4}\right)$, close to the parametric rate.

Theorem 2.1 assumes $d \geq 2$ (Assumption 1-(a)). We restrict ourselves to the case $d \geq 2$ for the sake of technical simplicity. However, the case $d=1$ can be derived with minor adaptations, assuming $r_{n} \rightarrow 0, n r_{n} /(\ln n)^{4 / 3} \rightarrow \infty$, and $n r_{n}^{3 / 2} \rightarrow 0$. In fact, the one-dimensional setting has already been explored in the related context of vacancy estimation (Hall, 1984).

As we mentioned in the introduction, the quantity $\lambda\left(S_{n} \Delta S_{f}\right)$ is closely related to the vacancy $V_{n}$ (Hall 1985, 1988), which is defined as in (1.2). A close inspection of the proof of Theorem 2.1 reveals that taking intersection with $S_{f}$ in the integrals does not effect things too much and, in fact, the asymptotic distributional behaviors of $\lambda\left(S_{n} \Delta S_{f}\right)$ and $V_{n}$ are nearly identical. As a consequence, we obtain the following result:

Theorem 2.2. Suppose that both Assumption Sets 1 and 2 are satisfied. If (r.i), (r.ii) and (r.iii) hold, then

$$
\left(\frac{n}{r_{n}^{d}}\right)^{1 / 4}\left(V_{n}-\mathbb{E} V_{n}\right) \xrightarrow{\mathscr{O}} \mathscr{N}\left(0, \sigma_{f}^{2}\right),
$$

where $\sigma_{f}^{2}>0$ is as in 2.3.

Surprisingly, the limiting variance $\sigma_{f}^{2}$ remains as in 2.3 . Theorem 2.2 was motivated by a remark by Hall (1985), who pointed out that a central limit theorem for vacancy in the case $n r_{n}^{d} \rightarrow \infty$ remained open.

## 3 Proof of Theorem 2.1

Our proof of Theorem 2.1 will borrow elements from Mason and Polonik (2009).

Set

$$
\begin{equation*}
\varepsilon_{n}=\frac{1}{\left(n r_{n}^{d}\right)^{1 / 4}} \tag{3.1}
\end{equation*}
$$

Observe that, from (r.ii) and (r.iii), the sequence ( $\varepsilon_{n}$ ) satisfies (e.i) $\varepsilon_{n} \rightarrow 0$ and (e.ii) $\varepsilon_{n} \sqrt{n r_{n}^{d}} \rightarrow \infty$. For future reference we note that from (r.i) and (r.iii), we get that

$$
\begin{equation*}
\frac{r_{n}}{\varepsilon_{n}} \rightarrow 0 . \tag{3.2}
\end{equation*}
$$

Set

$$
\mathscr{E}_{n}=\left\{x \in \mathbb{R}^{d}: f(x) \leq \varepsilon_{n}\right\} .
$$

Furthermore, let

$$
L_{n}\left(\varepsilon_{n}\right)=\int_{\mathscr{E}_{n}}\left|1\left\{f_{n}(x)>0\right\}-\mathbf{1}\{f(x)>0\}\right| \mathrm{d} x
$$

and

$$
\bar{L}_{n}\left(\varepsilon_{n}\right)=\int_{\mathscr{E}_{n}^{c}}\left|\mathbf{1}\left\{f_{n}(x)>0\right\}-\mathbf{1}\{f(x)>0\}\right| \mathrm{d} x
$$

Noting that, under Assumption Set $1, \lambda\left(S_{n} \Delta S_{f}\right)=L_{n}\left(\varepsilon_{n}\right)+\bar{L}_{n}\left(\varepsilon_{n}\right)$, our plan is to show that

$$
\begin{equation*}
\left(\frac{n}{r_{n}^{d}}\right)^{1 / 4}\left(L_{n}\left(\varepsilon_{n}\right)-\mathbb{E} L_{n}\left(\varepsilon_{n}\right)\right) \xrightarrow{\mathscr{O}} \mathscr{N}\left(0, \sigma_{f}^{2}\right) \tag{3.3}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(\frac{n}{r_{n}^{d}}\right)^{1 / 4}\left(\bar{L}_{n}\left(\varepsilon_{n}\right)-\mathbb{E} \bar{L}_{n}\left(\varepsilon_{n}\right)\right) \xrightarrow{\mathbb{P}} 0 \tag{3.4}
\end{equation*}
$$

which together imply the statement of Theorem 2.1 . To prove a central limit theorem for the random variable $L_{n}\left(\varepsilon_{n}\right)$, it turns out to be more convenient to first establish one for the Poissonized version of it formed by replacing $f_{n}(x)$ with

$$
\pi_{n}(x)=\sum_{i=1}^{N_{n}} \mathbf{1}_{\mathscr{B}\left(x, r_{n}\right)}\left(X_{i}\right),
$$

where $N_{n}$ is a mean $n$ Poisson random variable independent of the sample $X_{1}, \ldots, X_{n}$. By convention, we set $\pi_{n}(x)=0$ whenever $N_{n}=0$. The Poissonized version of $L_{n}\left(\varepsilon_{n}\right)$ is then defined by

$$
\Pi_{n}\left(\varepsilon_{n}\right)=\int_{\mathscr{E}_{n}}\left|\mathbf{1}\left\{\pi_{n}(x)>0\right\}-\mathbf{1}\{f(x)>0\}\right| \mathrm{d} x .
$$

The proof of Theorem 2.1 is organized as follows. First (Subsection 3.1), we determine the exact asymptotic behavior of the variance of $\Pi_{n}\left(\varepsilon_{n}\right)$. Then (Subsection 3.2), we prove a central limit theorem for $\Pi_{n}\left(\varepsilon_{n}\right)$. By means of a de-Poissonization result (Subsection 3.3), we then infer (3.3). In a final step (Subsection 3.4) we prove (3.4), which completes the proof of Theorem 2.1. This Poissonization/de-Poissonization methodology goes back to at least Beirlant, Györfi, and Lugosi (1994).

### 3.1 Exact asymptotic behavior of $\operatorname{Var}\left(\Pi_{n}\left(\varepsilon_{n}\right)\right)$

Let

$$
\Delta_{n}(x)=\left|1\left\{\pi_{n}(x)>0\right\}-1\{f(x)>0\}\right| .
$$

In the sequel, the letter $C$ will denote a positive constant, the value of which may vary from line to line.

Let $\left(\varepsilon_{n}\right)$ be the sequence of positive real numbers defined in (3.1). In this subsection, we intend to prove that, under the conditions of Theorem 2.1 ,

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \sqrt{\frac{n}{r_{n}^{d}}} \operatorname{Var}\left(\Pi_{n}\left(\varepsilon_{n}\right)\right)=\sigma_{f}^{2} \tag{3.5}
\end{equation*}
$$

where $\sigma_{f}^{2}$ is as in 2.3.
Towards this goal, observe first that

$$
\Pi_{n}\left(\varepsilon_{n}\right)=\int_{\tilde{\mathscr{E}}_{n}}\left|1\left\{\pi_{n}(x)>0\right\}-1\{f(x)>0\}\right| \mathrm{d} x,
$$

where we set

$$
\tilde{\mathscr{E}}_{n}=\mathscr{E}_{n} \cap S_{f}^{r_{n}}
$$

with

$$
S_{f}^{r_{n}}=\left\{x \in \mathbb{R}^{d}: \operatorname{dist}\left(x, S_{f}\right) \leq r_{n}\right\} .
$$

Clearly,

$$
\operatorname{Var}\left(\Pi_{n}\left(\varepsilon_{n}\right)\right)=\int_{\tilde{\mathscr{E}}_{n}} \int_{\tilde{\mathscr{E}}_{n}} \mathbb{C}\left(\Delta_{n}(x), \Delta_{n}(y)\right) \mathrm{d} x \mathrm{~d} y,
$$

where here and elsewhere $\mathbb{C}$ denotes 'covariance'. Since $\Delta_{n}(x)$ and $\Delta_{n}(y)$ are independent whenever $\|x-y\|>2 r_{n}$, we may write

$$
\operatorname{Var}\left(\Pi_{n}\left(\varepsilon_{n}\right)\right)=\int_{\tilde{\mathscr{E}}_{n}} \int_{\tilde{\mathscr{E}}_{n}} \mathbf{1}\left\{\|x-y\| \leq 2 r_{n}\right\} \mathbb{C}\left(\Delta_{n}(x), \Delta_{n}(y)\right) \mathrm{d} x \mathrm{~d} y
$$

Using the change of variable $y=x+2 r_{n} u$, we obtain

$$
\operatorname{Var}\left(\Pi_{n}\left(\varepsilon_{n}\right)\right)
$$

$$
=2^{d} r_{n}^{d} \int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}} \mathbf{1}_{\tilde{\mathscr{E}}_{n}}(x) \mathbf{1}_{\tilde{\mathscr{E}}_{n}}\left(x+2 r_{n} u\right) \mathbf{1}_{\mathscr{B}(0,1)}(u) \mathbb{C}\left(\Delta_{n}(x), \Delta_{n}\left(x+2 r_{n} u\right)\right) \mathrm{d} x \mathrm{~d} u
$$

By construction, whenever $n$ is large enough, $\tilde{E}_{n}$ is included in the tubular neighborhood $\mathscr{V}\left(\partial S_{f}, \rho\right)$ of $\partial S_{f}$ of radius $\rho>0$. In this case, each $x \in \tilde{\mathscr{E}}_{n}$ may be written as $x=p+v e_{p}$ as described in (2.1). Hence, for all large enough $n$, we obtain

$$
\begin{aligned}
\operatorname{Var} & \left(\Pi_{n}\left(\varepsilon_{n}\right)\right) \\
= & 2^{d} r_{n}^{d} \int_{\partial S_{f}} \int_{-r_{n}}^{\rho} \int_{\mathscr{B}(0,1)} \mathbf{1}_{\tilde{\mathscr{E}}_{n}}\left(p+v e_{p}\right) \mathbf{1}_{\tilde{\mathscr{E}}_{n}}\left(p+v e_{p}+2 r_{n} u\right) \\
& \times \Theta(p, v) \mathbb{C}\left(\Delta_{n}\left(p+v e_{p}\right), \Delta_{n}\left(p+v e_{p}+2 r_{n} u\right)\right) \mathrm{d} u \mathrm{~d} v v_{\sigma}(\mathrm{d} p) .
\end{aligned}
$$

For all $p \in \partial S_{f}$, let $\kappa_{p}\left(\varepsilon_{n}\right)$ be the distance between $p$ and the point $x$ of the set $\left\{x \in \mathbb{R}^{d}: f(x)=\varepsilon_{n}\right\}$ such that the vector $x-p$ is orthogonal to $\partial S_{f}$. Using the change of variable $v=t / \sqrt{n r_{n}^{d}}$, we may write

$$
\begin{aligned}
\operatorname{Var} & \left(\Pi_{n}\left(\varepsilon_{n}\right)\right) \\
= & \frac{2^{d} r_{n}^{d}}{\sqrt{n r_{n}^{d}}} \int_{\partial S_{f}} \int_{-\sqrt{n r_{n}^{d+2}}}^{\sqrt{n r_{n}^{d}} \kappa_{p}\left(\varepsilon_{n}\right)} \int_{\mathscr{B}(0,1)} \mathbf{1}_{\tilde{\mathscr{E}}_{n}}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}+2 r_{n} u\right) \Theta\left(p, \frac{t}{\sqrt{n r_{n}^{d}}}\right) \\
& \times \mathbb{C}\left(\Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right), \Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}+2 r_{n} u\right)\right) \mathrm{d} u \mathrm{~d} t v_{\sigma}(\mathrm{d} p) .
\end{aligned}
$$

For a justification of this change of variable, refer to equation (2.2) and equation (4.2) in the Appendix. By conditions (r.i) and (r.iii), $n r_{n}^{d+2} \rightarrow 0$. Consequently,

$$
\begin{align*}
& \sqrt{\frac{n}{r_{n}^{d}}} \operatorname{Var}\left(\Pi_{n}\left(\varepsilon_{n}\right)\right) \\
& =\mathrm{o}(1) \\
& \quad+2^{d} \int_{\partial S_{f}} \int_{0}^{\sqrt{n r_{n}^{d}} \kappa_{p}\left(\varepsilon_{n}\right)} \int_{\mathscr{B}(0,1)} \mathbf{1}_{\tilde{\mathscr{O}}_{n}}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} s e_{p}+2 r_{n} u\right) \Theta\left(p, \frac{t}{\sqrt{n r_{n}^{d}}}\right) \\
& \quad \times \mathbb{C}\left(\Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right), \Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}+2 r_{n} u\right)\right) \mathrm{d} u \mathrm{~d} t v_{\sigma}(\mathrm{d} p) . \tag{3.6}
\end{align*}
$$

To get the limit as $n \rightarrow \infty$ of the above integral, we will need the following lemma, whose proof is deferred to the end of the subsection.

Lemma 3.1. Let $p \in \partial S_{f}, t>0$ and $u \in \mathscr{B}(0,1)$ be fixed. Suppose that the conditions of Theorem 2.1 hold. Then

$$
\lim _{n \rightarrow \infty} \mathbb{C}\left(\Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right), \Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}+2 r_{n} u\right)\right)=\Phi(p, t, u)
$$

where $\Phi(p, t, u)$ is defined in Theorem 2.1

Returning to the proof of (3.5), we notice that by (4.4) in the Appendix and (e.ii) we have $\sqrt{n r_{n}^{d}} \kappa_{p}\left(\varepsilon_{n}\right) \rightarrow \infty$ as $n \rightarrow \infty$ and $\Theta(p, 0)=1$. Therefore, using Lemma 3.1 and the fact that for all $t>0$ and $u \in \mathscr{B}(0,1)$

$$
\mathbf{1}_{\tilde{\mathscr{O}}_{n}}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}}+2 r_{n} u\right) \rightarrow 1 \quad \text { as } n \rightarrow \infty
$$

we conclude that the function inside the integral in (3.6) converges pointwise to $\Phi(p, t, u)$ as $n \rightarrow \infty$.

We now proceed to sufficiently bound the function inside the integral in (3.6) to be able to apply the Lebesgue dominated convergence theorem. Towards this goal, fix $p \in \partial S_{f}, u \in \mathscr{B}(0,1)$ and $0<t \leq \sqrt{n r_{n}^{d}} \kappa_{p}\left(\varepsilon_{n}\right)$. Since $\Delta_{n}(x) \leq 1$ for all $x \in \mathbb{R}^{d}$, using the inequality $\left|\mathbb{C}\left(Y_{1}, Y_{2}\right)\right| \leq 2 \mathbb{E}\left|Y_{1}\right|$ whenever $\left|Y_{2}\right| \leq 1$, we have

$$
\begin{align*}
& \left|\mathbb{C}\left(\Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right), \Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}+2 r_{n} u\right)\right)\right| \\
& \quad \leq 2 \mathbb{E} \Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right) . \tag{3.7}
\end{align*}
$$

By the bound in (4.3) in the Appendix, we see that

$$
\begin{equation*}
\sup _{p \in \partial S_{f}} \kappa_{p}\left(\varepsilon_{n}\right) \rightarrow 0 \quad \text { as } \quad n \rightarrow \infty . \tag{3.8}
\end{equation*}
$$

Then, since $e_{p}$ is a normal vector to $\partial S_{f}$ at $p$ which is directed towards the interior of $S_{f}$, there exists an integer $N_{0}$ independent of $p, t$ and $u$ such that, for all $n \geq N_{0}$, the point $p+\left(t / \sqrt{n r_{n}^{d}}\right) e_{p}$ belongs to the interior of $S_{f}$. Therefore, $f\left(p+\left(t / \sqrt{n r_{n}^{d}}\right) e_{p}\right)>0$ and, letting

$$
\varphi_{n}(x)=\mathbb{P}\left(X \in \mathscr{B}\left(x, r_{n}\right)\right),
$$

we obtain

$$
\begin{align*}
\mathbb{E} \Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right) & =\mathbb{P}\left(\pi_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right)=0\right) \\
& =\mathbb{E}\left[\mathbb{P}\left(\forall i \leq N_{n}: \left.X_{i} \notin \mathscr{B}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}, r_{n}\right) \right\rvert\, N_{n}\right)\right] \\
& =\mathbb{E}\left[1-\varphi_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right)\right] \\
& =\exp \left[-n \varphi_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right)\right] \tag{3.9}
\end{align*}
$$

where we used the fact that $N_{n}$ is a mean $n$ Poisson distributed random variable independent of the sample. By a slight adaptation of the proof of Lemma A. 1 in Biau, Cadre, and Pelletier (2008) and
under Assumption 1-(b), one deduces that for all $x \in \mathscr{V}\left(\partial S_{f}, \rho\right) \cap \stackrel{\circ}{S}_{f}$, there exists a quantity $K_{n}(x)$ such that

$$
\begin{equation*}
\varphi_{n}(x)=r_{n}^{d} \omega_{d} f(x)+r_{n}^{d+2} K_{n}(x) \text { and } \sup _{n} \sup _{x \in \mathscr{Y}\left(\partial S_{f}, \rho\right) \cap \AA_{f}}\left|K_{n}(x)\right|<\infty . \tag{3.10}
\end{equation*}
$$

For all $x$ in $\mathscr{V}\left(\partial S_{f}, \rho\right)$ written as $x=p+u e_{p}$ with $p \in \partial S_{f}$ and $0 \leq u \leq \rho$, a Taylor expansion of $f$ at $p$ gives the expression

$$
f(x)=\frac{1}{2} D_{e_{p}}^{2} f\left(p+\xi e_{p}\right) u^{2}
$$

for some $0 \leq \xi \leq u$ since, by Assumption 1-(b), $D_{e_{p}} f(p)=0$. Thus, in our context, expanding $f$ at $p$, we may write

$$
n \varphi_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right)=\omega_{d} D_{e_{p}}^{2} f\left(p+\xi e_{p}\right) \frac{t^{2}}{2}+n r_{n}^{d+2} R_{n}(p, t),
$$

for some $0 \leq \xi \leq \kappa_{p}\left(\varepsilon_{n}\right)$, and where $R_{n}(p, t)$ satisfies

$$
\sup _{n} \sup \left\{\left|R_{n}(p, t)\right|: p \in \partial S_{f} \text { and } 0 \leq t \leq \sqrt{n r_{n}^{d}} \kappa_{p}\left(\varepsilon_{n}\right)\right\}<\infty .
$$

Furthermore, by (3.8), each point $p+\xi e_{p}$ falls in the tubular neighborhood $\mathscr{V}\left(\partial S_{f}, \rho\right)$ for all large enough $n$. Consequently, by Assumption 2-(c) there exists $\alpha>0$ independent of $n$ and $N_{1} \geq N_{0}$ independent of $p, t$ and $u$ such that, for all $n \geq N_{1}$,

$$
\inf _{p \in \partial S_{f}} D_{e_{p}}^{2} f\left(p+\xi e_{p}\right)>2 \alpha
$$

This, together with identity (3.9) and (r.i), (r.iii), which imply $n r_{n}^{d+2} \rightarrow 0$, leads to

$$
\begin{equation*}
\mathbb{E} \Delta_{n}\left(p+\frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right) \leq C \exp \left(-\omega_{d} \alpha t^{2}\right) \tag{3.11}
\end{equation*}
$$

for $n \geq N_{1}$ and all

$$
0 \leq t \leq \sqrt{n r_{n}^{d}} \sup _{p \in \partial S_{f}} \kappa_{p}\left(\varepsilon_{n}\right)
$$

Thus, using inequality (3.11), we deduce that the function on the left hand side of (3.7) is dominated by an integrable function of ( $p, t, u$ ), which is independent of $n$ provided $n \geq N_{1}$. Finally, we are in a position to apply the Lebesgue dominated convergence theorem, to conclude that

$$
\lim _{n \rightarrow \infty} \sqrt{\frac{n}{r_{n}^{d}}} \operatorname{Var}\left(\Pi_{n}\left(\varepsilon_{n}\right)\right)=2^{d} \int_{\partial S_{f}} \int_{0}^{\infty} \int_{\mathscr{B}(0,1)} \Phi(p, t, u) \operatorname{dudt} v_{\sigma}(\mathrm{d} p)=\sigma_{f}^{2}
$$

To be complete, it remains to prove Lemma 3.1.
Proof of Lemma 3.1 Let $x_{n}=p+\left(t / \sqrt{n r_{n}^{d}}\right) e_{p}$. Since $n r_{n}^{d} \rightarrow \infty$ and $n r_{n}^{d+2} \rightarrow 0$, both $x_{n}$ and $x_{n}+2 r_{n} u$ lie in the interior of $S_{f}$ for all large enough $n$. As a consequence, $f\left(x_{n}\right)>0$ and $f\left(x_{n}+\right.$ $\left.2 r_{n} u\right)>0$ for all large enough $n$. Thus,

$$
\mathbb{C}\left(\Delta_{n}\left(x_{n}\right), \Delta_{n}\left(x_{n}+2 r_{n} u\right)\right)
$$

$$
\begin{aligned}
= & \mathbb{C}\left(1\left\{\pi_{n}\left(x_{n}\right)=0\right\}, \mathbf{1}\left\{\pi_{n}\left(x_{n}+2 r_{n} u\right)=0\right\}\right) \\
= & \mathbb{P}\left(\pi_{n}\left(x_{n}\right)=0, \pi_{n}\left(x_{n}+2 r_{n} u\right)=0\right)-\mathbb{P}\left(\pi_{n}\left(x_{n}\right)=0\right) \mathbb{P}\left(\pi_{n}\left(x_{n}+2 r_{n} u\right)=0\right) \\
= & \mathbb{P}\left(\forall i \leq N_{n}: X_{i} \notin \mathscr{B}\left(x_{n}, r_{n}\right) \cup \mathscr{B}\left(x_{n}+2 r_{n} u, r_{n}\right)\right) \\
& -\mathbb{P}\left(\forall i \leq N_{n}: X_{i} \notin \mathscr{B}\left(x_{n}, r_{n}\right)\right) \mathbb{P}\left(\forall i \leq N_{n}: X_{i} \notin \mathscr{B}\left(x_{n}+2 r_{n} u, r_{n}\right)\right) \\
= & \exp \left[-n \mu\left(\mathscr{B}\left(x_{n}, r_{n}\right) \cup \mathscr{B}\left(x_{n}+2 r_{n} u, r_{n}\right)\right)\right] \\
& -\exp \left[-n \mu\left(\mathscr{B}\left(x_{n}, r_{n}\right)\right)-n \mu\left(\mathscr{B}\left(x_{n}+2 r_{n} u, r_{n}\right)\right)\right],
\end{aligned}
$$

where $\mu$ denotes the distribution of $X$. Let $B_{n}=\mathscr{B}\left(x_{n}, r_{n}\right) \cap \mathscr{B}\left(x_{n}+2 r_{n} u, r_{n}\right)$. Using the equality

$$
\mu\left(\mathscr{B}\left(x_{n}, r_{n}\right) \cup \mathscr{B}\left(x_{n}+2 r_{n} u, r_{n}\right)\right)=\varphi_{n}\left(x_{n}\right)+\varphi_{n}\left(x_{n}+2 r_{n} u\right)-\mu\left(B_{n}\right)
$$

we obtain

$$
\begin{align*}
& \mathbb{C}\left(\Delta_{n}\left(x_{n}\right), \Delta_{n}\left(x_{n}+2 r_{n} u\right)\right)  \tag{3.12}\\
& \quad=\exp \left[-n\left(\varphi_{n}\left(x_{n}\right)+\varphi_{n}\left(x_{n}+2 r_{n} u\right)\right)\right]\left[\exp \left(n \mu\left(B_{n}\right)\right)-1\right]
\end{align*}
$$

Now, $\mu\left(B_{n}\right)$ may be expressed as

$$
\mu\left(B_{n}\right)=f\left(x_{n}\right) \lambda\left(B_{n}\right)+\int_{B_{n}}\left(f(v)-f\left(x_{n}\right)\right) \mathrm{d} v
$$

Since $f$ is of class $\mathscr{C}^{1}$ on $\mathbb{R}^{d}$, by developing $f$ at $x_{n}$ in the above integral, we obtain

$$
\int_{B_{n}}\left(f(v)-f\left(x_{n}\right)\right) \mathrm{d} v=r_{n}^{d+1} R_{n}
$$

where $R_{n}$ satisfies

$$
\left|R_{n}\right| \leq C \sup _{K}\|\operatorname{grad} f\|,
$$

and $K$ is some compact subset of $\mathbb{R}^{d}$ containing $\partial S_{f}$ and of nonempty interior. Next, note that $\lambda\left(B_{n}\right)=r_{n}^{d} \beta(u)$, where

$$
\beta(u)=\lambda(\mathscr{B}(0,1) \cap \mathscr{B}(2 u, 1)) .
$$

Therefore, expanding $f$ at $p$ in the direction $e_{p}$, we obtain

$$
\mu\left(B_{n}\right)=\beta(u) \frac{t^{2}}{2 n} D_{e_{p}}^{2} f\left(p+\xi \frac{t}{\sqrt{n r_{n}^{d}}} e_{p}\right)+r_{n}^{d+1} R_{n}
$$

where $\xi \in(0,1)$. Hence by (r.iii),

$$
\lim _{n \rightarrow \infty} n \mu\left(B_{n}\right)=\beta(u) D_{e_{p}}^{2} f(p) \frac{t^{2}}{2}
$$

The above limit, together with identity (3.12) and (3.10), leads to the desired result.

### 3.2 Central limit theorem for $\Pi_{n}\left(\varepsilon_{n}\right)$

In this subsection we establish a central limit theorem for $\Pi_{n}\left(\varepsilon_{n}\right)$. Set

$$
S_{n}\left(\varepsilon_{n}\right)=\frac{a_{n}\left(\Pi_{n}\left(\varepsilon_{n}\right)-\mathbb{E} \Pi_{n}\left(\varepsilon_{n}\right)\right)}{\sigma_{n}}
$$

where $a_{n}=\left(n / r_{n}^{d}\right)^{1 / 4}$ and

$$
\sigma_{n}^{2}=\operatorname{Var}\left(a_{n}\left(\Pi_{n}\left(\varepsilon_{n}\right)-\mathbb{E} \Pi_{n}\left(\varepsilon_{n}\right)\right)\right) .
$$

We shall verify that as $n \rightarrow \infty$

$$
\begin{equation*}
S_{n}\left(\varepsilon_{n}\right) \xrightarrow{\mathscr{O}} \mathscr{N}(0,1) \tag{3.13}
\end{equation*}
$$

To show this we require the following special case of Theorem 1 of Shergin (1990).
Fact 3.1. Let $\left(X_{i, n}: \mathbf{i} \in \mathbb{Z}^{d}\right)$ denote a triangular array of mean zero m-dependent random fields, and let $\mathscr{J}_{n} \subset \mathbb{Z}^{d}$ be such that
(i) $\operatorname{Var}\left(\sum_{\mathbf{i} \in \mathscr{g}_{n}} X_{\mathbf{i}, n}\right) \rightarrow 1$ as $n \rightarrow \infty$, and
(ii) For some $2<s<3, \sum_{\mathbf{i} \in \mathscr{q}_{n}} \mathbb{E}\left|X_{\mathbf{i}, n}\right|^{s} \rightarrow 0$ as $n \rightarrow \infty$.

Then

$$
\sum_{i \in \mathscr{q}_{n}} X_{\mathrm{i}, n} \xrightarrow{\mathscr{O}} \mathscr{N}(0,1) .
$$

We use Shergin's result as follows. Recall the definition of $\varepsilon_{n}$ in (3.1) and also that

$$
\operatorname{Var}\left(\Pi_{n}\left(\varepsilon_{n}\right)\right)=\int_{\tilde{\mathscr{E}}_{n}} \int_{\tilde{\mathscr{E}}_{n}} \mathbb{C}\left(\Delta_{n}(x), \Delta_{n}(y)\right) \mathrm{d} x \mathrm{~d} y,
$$

with

$$
\tilde{\mathscr{E}}_{n}=\mathscr{E}_{n} \cap S_{f}^{r_{n}} .
$$

Next, consider the regular grid given by

$$
A_{\mathbf{i}}=\left(x_{i_{1}}, x_{i_{1}+1}\right] \times \ldots \times\left(x_{i_{d}}, x_{i_{d}+1}\right],
$$

where $\mathbf{i}=\left(i_{1}, \ldots, i_{d}\right), i_{1}, \ldots, i_{d} \in \mathbb{Z}$ and $x_{i}=i r_{n}$ for $i \in \mathbb{Z}$. Define

$$
R_{\mathbf{i}}=A_{\mathbf{i}} \cap \tilde{E}_{n}
$$

With $\mathscr{J}_{n}=\left\{\mathbf{i} \in \mathbb{Z}^{d}: A_{\mathbf{i}} \cap \tilde{\mathscr{E}}_{n} \neq \emptyset\right\}$ we see that $\left\{R_{\mathbf{i}}: \mathbf{i} \in \mathscr{\mathscr { L }}_{n}\right\}$ constitutes a partition of $\tilde{\mathscr{E}}_{n}$. Note that for each $\mathbf{i} \in \mathscr{J}_{n}$,

$$
\lambda\left(R_{\mathbf{i}}\right) \leq r_{n}^{d}
$$

We claim that for all large $n$

$$
\begin{equation*}
\operatorname{Card}\left(\mathscr{g}_{n}\right) \leq C \sqrt{\varepsilon_{n}} r_{n}^{-d} . \tag{3.14}
\end{equation*}
$$

To see this, we use the fact that, according to (4.3), there exists $\bar{\rho}>0$ such that for all large $n$, $\tilde{E}_{n} \subset \mathscr{V}\left(\partial S_{f}, \bar{\rho} \sqrt{\varepsilon_{n}}\right)$. Thus, since $r_{n} / \sqrt{\varepsilon_{n}} \rightarrow 0$ by (3.2),

$$
\bigcup_{i \in \mathscr{F}_{n}} A_{\mathbf{i}} \subset \mathscr{V}\left(\partial S_{f},(\bar{\rho}+2) \sqrt{\varepsilon_{n}}\right)
$$

and, consequently,

$$
r_{n}^{d} \operatorname{Card}\left(\mathscr{g}_{n}\right) \leq \lambda\left(\mathscr{V}\left(\partial S_{f},(\bar{\rho}+2) \sqrt{\varepsilon_{n}}\right)\right) \leq C \sqrt{\varepsilon_{n}} .
$$

Keeping in mind the fact that for any disjoint sets $B_{1}, \ldots, B_{k}$ in $\mathbb{R}^{d}$ such that, for $1 \leq i \neq j \leq k$,

$$
\inf \left\{\|x-y\|: x \in B_{i}, y \in B_{j}\right\}>r_{n}
$$

then

$$
\int_{B_{i}} \Delta_{n}(x) \mathrm{d} x, i=1, \ldots, k, \text { are independent, }
$$

we can easily infer that

$$
X_{\mathbf{i}, n}=\frac{a_{n} \int_{R_{\mathbf{i}}}\left(\Delta_{n}(x)-\mathbb{E} \Delta_{n}(x)\right) \mathrm{d} x}{\sigma_{n}}, \quad \mathbf{i} \in \mathscr{J}_{n},
$$

constitutes a 1-dependent random field on $\mathbb{Z}^{d}$.

Recalling that $a_{n}=\left(n / r_{n}^{d}\right)^{1 / 4}$ and $\sigma_{n}^{2} \rightarrow \sigma_{f}^{2}$ as $n \rightarrow \infty$ by we get, for all $\mathbf{i} \in \mathscr{J}_{n}$,

$$
\left|X_{\mathbf{i}, n}\right| \leq \frac{a_{n}}{\sigma_{n}} \lambda\left(R_{\mathbf{i}}\right) \leq C\left(n r_{n}^{3 d}\right)^{1 / 4} .
$$

Hence, by (3.14),

$$
\sum_{i \in \mathscr{g}_{n}} \mathbb{E}\left|X_{\mathrm{i}, n}\right|^{5 / 2} \leq C\left(\operatorname{Card}\left(\mathscr{g}_{n}\right)\right)\left(n r_{n}^{3 d}\right)^{5 / 8} \leq C\left(n r_{n}^{3 d / 2}\right)^{1 / 2}
$$

Clearly this bound when combined with (r.iii) and $d \geq 2$, gives as $n \rightarrow \infty$,

$$
\sum_{\mathbf{i} \in \mathscr{g}_{n}} \mathbb{E}\left|X_{\mathrm{i}, n}\right|^{5 / 2} \rightarrow 0,
$$

which by the Shergin Fact 3.1 (with $s=5 / 2$ ) yields

$$
S_{n}\left(\varepsilon_{n}\right)=\sum_{\mathbf{i} \in \mathscr{g}_{n}} X_{\mathbf{i}, n} \xrightarrow{\mathscr{O}} \mathscr{N}(0,1) .
$$

Thus (3.13) holds.

### 3.3 Central limit theorem for $L_{n}\left(\varepsilon_{n}\right)$

Now we shall de-Poissonize the central limit for $\Pi_{n}\left(\varepsilon_{n}\right)$ to obtain one for $L_{n}\left(\varepsilon_{n}\right)$. Observe that

$$
\begin{equation*}
\left(S_{n}\left(\varepsilon_{n}\right) \mid N_{n}=n\right) \stackrel{\mathscr{O}}{=} \frac{a_{n}\left(L_{n}\left(\varepsilon_{n}\right)-\mathbb{E} \Pi_{n}\left(\varepsilon_{n}\right)\right)}{\sigma_{n}} . \tag{3.15}
\end{equation*}
$$

Our next goal is to apply the following version of a theorem in Beirlant and Mason (1995) (see also Polonik and Mason, 2009) to infer from (3.13) that

$$
\begin{equation*}
\frac{a_{n}\left(L_{n}\left(\varepsilon_{n}\right)-\mathbb{E} \Pi_{n}\left(\varepsilon_{n}\right)\right)}{\sigma_{n}} \xrightarrow{\mathscr{O}} \mathscr{N}(0,1) . \tag{3.16}
\end{equation*}
$$

Fact 3.2. Let $N_{1, n}$ and $N_{2, n}$ be independent Poisson random variables with $N_{1, n}$ being Poisson ( $n \beta_{n}$ ) and $N_{2, n}$ being Poisson $\left(n\left(1-\beta_{n}\right)\right.$ ) where $\beta_{n} \in(0,1)$. Denote $N_{n}=N_{1, n}+N_{2, n}$ and set

$$
U_{n}=\frac{N_{1, n}-n \beta_{n}}{\sqrt{n}} \text { and } V_{n}=\frac{N_{2, n}-n\left(1-\beta_{n}\right)}{\sqrt{n}} .
$$

Let $\left(S_{n}\right)$ be a sequence of real-valued random variables such that
(i) For each $n \geq 1$, the random vector $\left(S_{n}, U_{n}\right)$ is independent of $V_{n}$.
(ii) For some $\sigma^{2}<\infty, S_{n} \xrightarrow{\mathscr{B}} \sigma Z$ as $n \rightarrow \infty$.
(iii) $\beta_{n} \rightarrow 0$ as $n \rightarrow \infty$.

Then, for all $x$,

$$
\mathbb{P}\left(S_{n} \leq x \mid N_{n}=n\right) \rightarrow \mathbb{P}(\sigma Z \leq x) .
$$

Let

$$
\mathscr{D}_{n}=\left\{x \in \mathbb{R}^{d}: f(x) \leq 2 \varepsilon_{n}\right\} .
$$

We shall apply Fact 3.2 to $S_{n}\left(\varepsilon_{n}\right)$ with

$$
N_{1, n}=\sum_{i=1}^{N_{n}} 1\left\{X_{i} \in \mathscr{D}_{n}\right\}, \quad N_{2, n}=\sum_{i=1}^{N_{n}} 1\left\{X_{i} \notin \mathscr{D}_{n}\right\}
$$

and $\beta_{n}=\mathbb{P}\left(X \in \mathscr{D}_{n}\right)$. Let

$$
M=\sup _{x \in \mathbb{R}^{d}} \sum_{i=1}^{d}\left|\frac{\partial f(x)}{\partial x_{i}}\right| .
$$

We see that for all large enough $n$, whenever $x \in \mathscr{E}_{n}$ and $y \in \mathscr{B}\left(x, r_{n}\right)$, by the mean value theorem,

$$
f(y) \leq f(x)+M r_{n} \leq \varepsilon_{n}\left(1+\frac{M r_{n}}{\varepsilon_{n}}\right) .
$$

This combined with (3.2) implies for all large $n$

$$
\left(\bigcup_{x \in \mathscr{C}_{n}} \mathscr{B}\left(x, r_{n}\right)\right) \cap \mathscr{D}_{n}^{c}=\varnothing .
$$

Therefore for all large enough $n$, the random variables $S_{n}\left(\varepsilon_{n}\right)$ and $N_{2, n}$ are independent. Thus by (3.15) and $\beta_{n} \rightarrow 0$, we can apply Fact 3.2 to conclude that (3.16) holds.

Next we proceed just as in Mason and Polonik (2009) to apply a moment bound given in Lemma 2.1 of Giné, Mason, and Zaitsev (2003) to show that

$$
\mathbb{E}\left(a_{n}\left(L_{n}\left(\varepsilon_{n}\right)-\mathbb{E} \Pi_{n}\left(\varepsilon_{n}\right)\right)\right)^{2} \leq 2 \sigma_{n}^{2} .
$$

Therefore, since by (3.5),

$$
\sigma_{n}^{2} \rightarrow \sigma_{f}^{2}<\infty,
$$

the sequence $\left(a_{n}\left(L_{n}\left(\varepsilon_{n}\right)-\mathbb{E} \Pi_{n}\left(\varepsilon_{n}\right)\right)\right)$ is uniformly integrable. Hence we get using (3.16) that

$$
a_{n}\left(\mathbb{E} L_{n}\left(\varepsilon_{n}\right)-\mathbb{E} \Pi_{n}\left(\varepsilon_{n}\right)\right) \rightarrow 0
$$

Thus, still by (3.16),

$$
\frac{a_{n}\left(L_{n}\left(\varepsilon_{n}\right)-\mathbb{E} L_{n}\left(\varepsilon_{n}\right)\right)}{\sigma_{n}} \xrightarrow{\mathscr{B}} \mathscr{N}(0,1) .
$$

This in turn implies (3.3).

### 3.4 Completion of the proof of Theorem 2.1

It remains to verify (3.4). Observe that

$$
\bar{L}_{n}\left(\varepsilon_{n}\right)=\int_{\mathscr{E}_{n}^{c}}\left|\mathbf{1}\left\{f_{n}(x)>0\right\}-\mathbf{1}\{f(x)>0\}\right| \mathrm{d} x=\int_{\mathscr{E}_{n}^{c}} \mathbf{1}\left\{f_{n}(x)=0\right\} \mathrm{d} x .
$$

To begin with note that for all $x \in \mathscr{E}_{n}^{c}$,

$$
\mathbb{P}\left(f_{n}(x)=0\right)=\left(1-\varphi_{n}(x)\right)^{n} \leq \exp \left(-n \varphi_{n}(x)\right),
$$

where we recall that

$$
\varphi_{n}(x)=\mathbb{P}\left(X \in \mathscr{B}\left(x, r_{n}\right)\right) .
$$

Since $f$ is of class $\mathscr{C}^{1}$, we have, for all $t \in \mathscr{B}\left(x, r_{n}\right)$,

$$
|f(t)-f(x)| \leq \kappa_{1} r_{n}
$$

where $\kappa_{1}>0$ is independent of $x$. Therefore, using the properties $f(x) \geq \varepsilon_{n}$ and $r_{n} / \varepsilon_{n} \rightarrow 0$ by (3.2), we obtain

$$
\begin{aligned}
\varphi_{n}(x)=\mathbb{P}\left(X \in \mathscr{B}\left(x, r_{n}\right)\right) & =f(x) \omega_{d} r_{n}^{d}+\int_{\mathscr{B}\left(x, r_{n}\right)}(f(t)-f(x)) \mathrm{d} t \\
& \geq \varepsilon_{n} r_{n}^{d}\left(\omega_{d}-\kappa_{1} \frac{r_{n}}{\varepsilon_{n}}\right) \\
& \geq \kappa_{2} \varepsilon_{n} r_{n}^{d},
\end{aligned}
$$

where $\kappa_{2}>0$ is independent of $x$. Thus,

$$
\mathbb{P}\left(f_{n}(x)=0\right) \leq \exp \left(-\kappa_{2} \varepsilon_{n} n r_{n}^{d}\right) .
$$

Consequently,

$$
a_{n} \mathbb{E} \bar{L}_{n}\left(\varepsilon_{n}\right) \leq\left(\frac{n}{r_{n}^{d}}\right)^{1 / 4} \exp \left(-\kappa_{2} \varepsilon_{n} n r_{n}^{d}\right) .
$$

By (r.ii), for all $n$ large enough, $r_{n}^{-d} \leq n$. Hence,

$$
\frac{n}{r_{n}^{d}} \leq n^{2} .
$$

Besides, provided $n$ is large enough, we get by (r.ii) that $n r_{n}^{d} \geq\left(\ln n / \kappa_{2}\right)^{4 / 3}$. Consequently,

$$
\varepsilon_{n} n r_{n}^{d}=\left(n r_{n}^{d}\right)^{3 / 4} \geq \frac{1}{\kappa_{2}} \ln n .
$$

This gives the bound holding for all large $n$,

$$
\left(\frac{n}{r_{n}^{d}}\right)^{1 / 4} \exp \left(-\kappa_{2} \varepsilon_{n} n r_{n}^{d}\right) \leq \sqrt{n} \exp (-\ln n)=n^{-1 / 2}
$$

which goes to 0 as $n \rightarrow \infty$. This implies that both $a_{n} \mathbb{E} \bar{L}_{n}\left(\varepsilon_{n}\right) \rightarrow 0$ and $a_{n} \bar{L}_{n}\left(\varepsilon_{n}\right) \xrightarrow{\mathbb{P}} 0$, and thus establishes (3.4). The proof of Theorem 2.1 now follows from (3.3) and (3.4).

## 4 Appendix: Properties of $\{x: 0<f(x) \leq \varepsilon\}$

Under Assumption Sets 1 and 2, we know that there exists a tubular neighborhood $\mathscr{V}\left(\partial S_{f}, \rho\right)$ of $\partial S_{f}$ of radius $\rho$ such that first,

$$
\begin{equation*}
0<\inf _{p \in \partial S_{f}} \inf _{0 \leq u \leq \rho} D_{e_{p}}^{2} f\left(p+u e_{p}\right) \leq \sup _{p \in \partial S_{f}} \sup _{0 \leq u \leq \rho} D_{e_{p}}^{2} f\left(p+u e_{p}\right)<\infty, \tag{4.1}
\end{equation*}
$$

and second,

$$
\inf \left\{f(x): x \in S_{f} \backslash \mathscr{V}\left(\partial S_{f}, \rho\right)\right\}=\sup \left\{f(x): x \in \mathscr{V}\left(\partial S_{f}, \rho\right)\right\}:=\varepsilon_{0}>0
$$

Consequently, for all $0<\varepsilon<\varepsilon_{0}$, we have

$$
\left\{x \in \mathbb{R}^{d}: 0<f(x) \leq \varepsilon\right\} \subset \mathscr{V}\left(\partial S_{f}, \rho\right) .
$$

Moreover, (4.1), together with the fact that $f=0$ on $\partial S_{f}$, entails that for all $p \in \partial S_{f}$, the maps $u \mapsto f\left(p+u e_{p}\right)$ are strictly convex and strictly increasing on [0, $\left.\rho\right]$. Therefore, for all $0<\varepsilon<\varepsilon_{0}$, and for all $p \in \partial S_{f}$ there exists a unique real number $\kappa_{p}(\varepsilon)$ such that

$$
f\left(p+\kappa_{p}(\varepsilon) e_{p}\right)=\varepsilon .
$$

Note that we also have the relation

$$
\begin{equation*}
\bigcup_{p \in \partial S_{f}}\left\{p+u e_{p}: 0 \leq u \leq \kappa_{p}(\varepsilon)\right\}=\{x: 0<f(x) \leq \varepsilon\} \cup \partial S_{f}, \tag{4.2}
\end{equation*}
$$

for all $0<\varepsilon<\varepsilon_{0}$.

Since $D_{e_{p}} f(p)=0$ for all $p \in \partial S_{f}$ by assumption, by using a second order expansion of $f$ at $p$ in combination with (4.1), we have

$$
\begin{equation*}
\sup _{p \in \partial S_{f}} \kappa_{p}(\varepsilon) \leq\left[\frac{1}{2} \inf _{p \in \partial S_{f}} \inf _{0 \leq u \leq \rho} D_{e_{p}}^{2} f\left(p+u e_{p}\right)\right]^{-\frac{1}{2}} \sqrt{\varepsilon} \tag{4.3}
\end{equation*}
$$

The same argument gives

$$
\begin{equation*}
\inf _{p \in \partial S_{f}} \kappa_{p}(\varepsilon) \geq\left[\frac{1}{2} \sup _{p \in \partial S_{f}} \sup _{0 \leq u \leq \rho} D_{\varepsilon_{p}}^{2} f\left(p+u e_{p}\right)\right]^{-1 / 2} \sqrt{\varepsilon} . \tag{4.4}
\end{equation*}
$$

Acknowledgments. We thank two referees for valuable comments and insightful suggestions.
