# ON THE INTEGRABILITY OF STRONG MAXIMAL FUNCTIONS CORRESPONDING TO DIFFERENT FRAMES

#### G. ONIANI

ABSTRACT. For the frame  $\theta$  in  $\mathbb{R}^n$ , let  $B_2(\theta)(x)$   $(x \in \mathbb{R}^n)$  be a family of all *n*-dimensional rectangles containing x and having edges parallel to the straight lines of  $\theta$ , and let  $M_{B_2(\theta)}$  be a maximal operator corresponding to  $B_2(\theta)$ . The main result of the paper is the following

**Theorem.** For any function  $f \in L(1 + \ln^+ L)(\mathbb{R}^n)$   $(n \geq 2)$  there exists a measure preserving and invertible mapping  $\omega : \mathbb{R}^n \to \mathbb{R}^n$  such that

1.  $\{x : \omega(x) \neq x\} \subset \operatorname{supp} f;$ 2.  $\sup_{\theta \in \theta(\mathbb{R}^n)} \int_{\{M_{B_2(\theta)}(f \circ \omega) > 1\}} M_{B_2(\theta)}(f \circ \omega) < \infty.$ 

This theorem gives a general solution of M. de Guzmán's problem that was previously studied by various authors.

### 1. Definitions and the Notation

Let B be a mapping defined on  $\mathbb{R}^n$  such that, for every  $x \in \mathbb{R}^n$ , B(x) is a family of open bounded sets in  $\mathbb{R}^n$  containing x. The maximal operator  $M_B$  corresponding to B is defined as follows: for  $f \in L_{loc}(\mathbb{R}^n)$  and  $x \in \mathbb{R}^n$ 

$$M_B(f)(x) = \sup_{R \in B(x)} \frac{1}{|R|} \int_R |f| \quad \text{if} \quad B(x) \neq \emptyset,$$

and

$$M_B(f)(x) = 0$$
 if  $B(x) = \emptyset$ .

A frame in  $\mathbb{R}^n$  will be called a set whose elements are *n* pairwise orthogonal straight lines passing through the origin *O*. Frames will be denoted by  $\theta$ ,  $\theta = \{\theta^1, \ldots, \theta^n\}$ . Under  $\theta_0$  will be meant a frame  $\{Ox^1, \ldots, Ox^n\}$ , where  $Ox^1, \ldots, Ox^n$  are the coordinate axes of  $\mathbb{R}^n$ . A set of all frames in  $\mathbb{R}^n$  will be denoted by  $\theta(\mathbb{R}^n)$ .

Key words and phrases. Strong maximal operator, rectangle, frame.

A set congruent to a set of the form  $I_1 \times \cdots \times I_n$ , where  $I_1, \ldots, I_n$  are intervals of positive length on the straight line, will be called an *n*-dimensional rectangle or simply a rectangle in  $\mathbb{R}^n$ .

The frame  $\theta = \{\theta^1, \ldots, \theta^n\}$  for which the sides of the rectangle I are parallel to the corresponding straight lines  $\theta^j$   $(j = 1, \ldots, n)$  will be called the frame of I which will be denoted by  $\theta(I)$ .

For a nonempty set  $E \subset \theta(\mathbb{R}^n)$  we shall denote by  $B_2(E)(x)$   $(x \in \mathbb{R}^n)$  a family of all rectangles I in  $\mathbb{R}^n$  with the properties  $x \in I$ ,  $\theta(I) \in E$ . Instead of  $B_2(\{\theta\})$  we shall write  $B_2(\theta)$  when  $E = \{\theta\}$ , and  $B_2$  when  $\theta = \theta_0$ .

Since  $M_{B_2}$  is said to be a strong maximal operator, it is natural to call  $M_{B_2(\theta)}$  the strong maximal operator corresponding to the frame  $\theta$ .

By  $B_1(x)$   $(x \in \mathbb{R}^n)$  we denote a family of all cubic intervals in  $\mathbb{R}^n$  containing x (for n = 1 a one-dimensional interval is understood here as a square interval).

The support  $\{x \in \mathbb{R}^n : f(x) \neq 0\}$  of the function  $f : \mathbb{R}^n \to \mathbb{R}$  will be denoted by supp f.

### 2. Formulation of the Question and the Main Result

The class  $L(1 + \ln^+ L)(\mathbb{R}^n)$  was characterized by Guzmán and Welland ([1, 2], Ch. II, §6) by means of the maximal operator  $M_{B_1}$ . In particular, they have shown that for  $f \in L(\mathbb{R}^n)$  the following conditions are equivalent:

1. 
$$f \in L(1 + \ln^+ L)(\mathbb{R}^n),$$
  
2.  $\int_{\{M_{B_1}(f) > 1\}} M_{B_1}(f) < \infty.$ 

From the strong maximal Jessen–Marcinkiewicz–Zygmund's theorem it follows that if

$$f \in L(1 + \ln^+ L)^n(\mathbb{R}^n), \tag{2.1}$$

then

$$\int_{M_{B_2}(f)>1\}} M_{B_2}(f) < \infty.$$
(2.2)

Guzmán (see [2], Ch. II, §6) posed the question whether it was possible to characterize the class  $L(1 + \ln^+ L)^2(\mathbb{R}^2)$  by the operator  $M_{B_2}$  as it was done for the class  $L(1 + \ln^+ L)(\mathbb{R}^n)$  using the operator  $M_{B_1}$ , i.e., whether conditions (2.1) and (2.2) are equivalent for  $f \in L(\mathbb{R}^2)$ . Gogoladze [4, 5] and Bagby [6] answered this question in the negative.

{

It can be easily verified that much more than (2.2) is fulfilled for  $f \in L(1 + \ln^+ L)^n(\mathbb{R}^n)$ , in particular,

$$\sup_{\theta \in \theta(\mathbb{R}^n)} \int_{\{M_{B_2(\theta)}(f) > 1\}} M_{B_2(\theta)}(f) < \infty.$$
(2.3)

A question arises if it is possible to characterize the class  $L(1+\ln^+ L)^n(\mathbb{R}^n)$ by condition (2.3), i.e., if conditions (2.1) and (2.3) are equivalent for  $f \in L(\mathbb{R}^n)$   $(n \ge 2)$ .

This question was answered in the negative for n = 2 in [7]. The answer remains negative for an arbitrary n > 2 as well. In particular, the following theorem is valid.

**Theorem 1.** For any function  $f \in L(1+\ln^+ L)(\mathbb{R}^n)$   $(n \ge 2)$  there exists a measure preserving and invertible mapping  $\omega : \mathbb{R}^n \to \mathbb{R}^n$  such that

1. 
$$\{x : \omega(x) \neq x\} \subset \operatorname{supp} f$$
,  
2.  $\sup_{\theta \in \theta(\mathbb{R}^n)} \int_{\{M_{B_2(\theta)}(f \circ \omega) > 1\}} M_{B_2(\theta)}(f \circ \omega) < \infty$ 

Note that we had to use many new arguments to proceed from the case to n = 2 to the case of arbitrary  $(n \ge 2)$ .

Theorem 1 was first formulated by us in a less general for in [8].

### 3. AUXILIARY STATEMENTS

Throughout the discussion preceding Lemma 4 we shall consider the spaces  $\mathbb{R}^n$  with  $n \geq 2$ .

We shall call a strip in  $\mathbb{R}^n$  an open set bounded by two different parallel hyperplanes, i.e., a set of the form

$$\left\{ x \in \mathbb{R}^n : a < \alpha_1 x^2 + \dots + \alpha_n x^n < b \right\},\$$

where a, b (a > b) and  $\alpha_1, \ldots, \alpha_n$   $(\alpha_1^2 + \cdots + \alpha_n^2 > 0)$  are some real numbers, and  $x^k$   $(k = 1, \ldots, n)$  here and everywhere below denotes the k-th coordinate of the point  $x \in \mathbb{R}^n$ . The strip width will be called the distance between the hyperplanes that bound the strip, i.e., the number b - a will be called the strip width.

In the sequel it will always be assumed that  $\chi_A$  is the characteristic function of the set A.

**Lemma 1.** For every  $x \in \mathbb{R}^n$  let B(x) be a family of open bounded and convex sets in  $\mathbb{R}^n$ , containing x, and let S be a strip in  $\mathbb{R}^n$  of width  $\delta$ . Then

$$M_B(\chi_S)(x) < \frac{2^n \delta}{\operatorname{dist}(x,S)}$$
 when  $\operatorname{dist}(x,S) \ge \delta$ .

*Proof.* Let dist $(x, S) \ge \delta$  and  $R \in B(x), R \cap S \neq \emptyset$ .

Among the hyperplanes bounding S we denote by  $\Gamma$  the hyperplane which is the closest to x. It is obvious that  $R \cap \Gamma \neq \emptyset$ . For every  $y \in R \cap \Gamma$  let  $\Delta_y$ be a segment connecting x and y. It is assumed that  $K = \bigcup_{y \in R \cap \Gamma} \Delta_y$ . Since

R is convex, we have

$$K \subset R. \tag{3.1}$$

Let H be the homothety centered at x and with the coefficient

$$\alpha = \frac{\operatorname{dist}(x,S) + \delta}{\operatorname{dist}(x,S)}$$

Let us show that

$$R \cap S \subset H(K) \backslash K. \tag{3.2}$$

Indeed, assume that  $z \in R \cap S$  and denote by y the point at which the segment connecting x and z intersects with  $\Gamma$ . Since  $x, z \in R$ , by virtue of the convexity of R we have  $y \in R$ . Therefore  $y \in R \cap \Gamma$ . By the definitions of the set K and homothety H we easily obtain  $z \in H(\Delta_y) \subset H(K)$ .  $(R \cap S) \cap K = \emptyset$ . Therefore  $z \notin K$ . Thus  $z \in H(K) \setminus K$ . Thus, since  $z \in R \cap S$  is arbitrary, we have proved (3.2).

Using (3.1), (3.2), the definition of H and obvious inequality  $\alpha^n-1<\frac{2^n\delta}{{\rm dist}(x,S)}$  we can write

$$\frac{1}{|R|} \int\limits_R \chi_{\scriptscriptstyle S} = \frac{|R \cap S|}{|R|} \leq \frac{|H(K) \backslash K|}{|K|} = \frac{(\alpha^n - 1)|K|}{|K|} < \frac{2^n \delta}{\operatorname{dist}(x,S)},$$

which, obviously, proves the lemma.  $\Box$ 

For the rectangle I in  $\mathbb{R}^n$  having pairwise orthogonal edges of lengths  $\delta_1, \delta_2, \ldots, \delta_n$ , where  $\delta_1 \leq \delta_2 \leq \cdots \leq \delta_n$ , we introduce the notation:

(1) r(I) is a number  $\delta_2/\delta_1$ ;

(2) when r(I) > 1, for  $h \ge 1$ , J(I,h) is an open rectangle with the following properties: J(I,h) has the same center and frame as I; the length of the edges of J(I,h) parallel to the edges of I of the length  $\delta_1$  is equal to  $(2^{n+1}h+1)\delta_1$ , while the length of the edges of J(I,h) parallel to the edges of I of length  $\delta_j$  (j = 2, ..., n) is equal to  $3\delta_j$ ;

(3) for r(I) > 1,  $\ell_I$  is a straight line passing through O and parallel to the edges of I of length  $\delta_1$ .

For the straight line  $\ell$  in  $\mathbb{R}^n$  and  $0 < \varepsilon < \pi/4$  we assume

$$E(\ell,\varepsilon) = \left\{ \theta \in \theta(\mathbb{R}^n) : \angle (\ell,\theta^j) < \pi/2 - \varepsilon, \ j = 1, \dots, n \right\},\$$

where  $\angle(\cdot, \cdot)$  is the angle lying between the two straight lines.

**Lemma 2.** Let I be a rectangle in  $\mathbb{R}^n$ , h > 1,  $0 < \varepsilon < \pi/4$ ,  $r(I) > \frac{nh}{\sin \varepsilon}$ , and  $E = E(\ell_I, \varepsilon)$ . Then

$$\left\{M_{B_2(E)}(h\chi_I) > 1\right\} \subset J(I,h),$$

and therefore

$$|\{M_{B_2(E)}(h\chi_I) > 1\}| \le 9^n h|I|.$$

*Proof.* Without loss of generality we assume that

$$I = (-\delta_1/2, \delta_1/2) \times \cdot \times (-\delta_n/2, \delta_n/2),$$

where  $\delta_1 < \delta_1 \leq \cdots \leq \delta_n$ . We write

$$S_{1} = \left\{ x \in \mathbb{R}^{n} : |x^{1}| < \left(2^{n}h + \frac{1}{2}\right)\delta_{1} \right\},\$$
  
$$S_{j} = \left\{ x \in \mathbb{R}^{n} : |x^{j}| < 3\delta_{j}/2 \right\} \quad (j = 2, \dots, n).$$

As is easily seen, J(I, h) is the intersection of the strips  $S_1, \ldots, S_n$ .

Let  $S = \{x \in \mathbb{R}^n : |x^1| < \delta_1/2\}$  and  $x \in S_1$ . Obviously, dist $(x, S) \ge 2^n h \delta_1$ . Now by lemma 1 we write

$$M_{B_{2}(E)}(h\chi_{I})(x) = hM_{B_{2}(E)}(\chi_{I})(x) \le hM_{B_{2}(E)}(\chi_{S})(x) < \frac{h2^{n}\delta_{1}}{\operatorname{dist}(x,S)} \le 1.$$

Hence we conclude that

$$\{M_{B_2(E)}(h\chi_I) > 1\} \subset S_1.$$
(3.3)

Consider arbitrary  $2 \leq j \leq n$ . Let  $x \notin S_j$ ,  $J \in B_2(E)(x)$ , and  $J \cap I \neq \emptyset$ . Obviously, dist $(x, I) \geq \delta_j$ , and we have

$$\operatorname{dist}(x, I) \leq \operatorname{diam} I < t_1 + t_2 + \dots + t_n,$$

where  $t_1, t_2, \ldots, t_n$  are lengths of orthogonal edges of J. Therefore there exists a side of J with the length greater than  $\delta_j/n$ . We can represent J as a union of pairwise nonintersecting intervals equal and parallel to abovementioned edge:  $J = \bigcup_{\alpha \in T} \Delta_{\alpha}$ . Obviously,

$$|\Delta_{\alpha}|_{1} > \delta_{j}/n \quad (\alpha \in T).$$

$$(3.4)$$

(Here and everywhere below, for the set A contained in some k-dimensional (k = 1, ..., n - 1) affine subspace  $\mathbb{R}^n$ , we denote by  $|A|_k$  k-dimensional measure of A.)

Let us prove that

$$\frac{h|\Delta_{\alpha} \cap I|_1}{|\Delta_{\alpha}|_1} \le 1 \quad (\alpha \in T).$$
(3.5)

Indeed, let  $\ell$  be the straight line containing the segment  $\Delta_{\alpha}$ . It is easy to see that  $|\ell \cap S|_1 = \delta_1 / \cos \angle (\ell, Ox^1)$ .  $J \in B_2(E)(x)$ , Therefore  $\angle (\ell, Ox^1) < \delta_1 / \cos \angle (\ell, Ox^1)$ .

 $\pi/2 - \varepsilon$ . Consequently,  $|\ell \cap S|_1 \leq \frac{\delta_1}{\cos(\pi/2-\varepsilon)} = \frac{\delta_1}{\sin\varepsilon}$ , which by virtue of (3.4) and the inequality  $\delta_j > r(I)\delta_1 \geq \frac{nh\delta_1}{\sin\varepsilon}$  implies

$$\frac{h|\Delta_{\alpha} \cap I|_1}{|\Delta_{\alpha}|_1} \le \frac{h|\ell \cap S|_1}{\delta_j/n} \le \frac{h\delta_1}{\sin\varepsilon} \frac{\sin\varepsilon}{h\delta_1} = 1.$$

It is not difficult to verify that

$$\frac{1}{|J|} \int_{J} h\chi_{I} = \frac{h|J \cap I|}{|J|} \le \sup_{\alpha \in T} \frac{h|\Delta_{\alpha} \cap I|_{1}}{|\Delta_{\alpha}|_{1}}.$$

Hence, by (3.5),

$$\frac{1}{|J|} \int_{I} h\chi_{I} \le 1,$$

which, taking into account the arbitrariness of  $J \in B_2(E)(x)$ ,  $L \cap I \neq \emptyset$ , allowsus to conclude that

$$M_{B_2(E)}(h\chi_I)(x) \le 1 \quad (x \notin S_j, \quad 2 \le j \le n).$$

This and (3.3) imply

$$\left\{M_{B_2(E)}(h\chi_I) > 1\right\} \subset \bigcap_{j=1}^n S_j = J(I,h). \quad \Box$$

**Lemma 3.** If among the pairwise different straight lines  $\ell_1, \ldots, \ell_k$   $(k \ge n)$  in  $\mathbb{R}^n$  which pass through the same point none of n lie in the same hyperplane, then there exists  $\varepsilon > 0$  such that for every straight line  $\ell$  in  $\mathbb{R}^n$  and every  $1 \le k_1 < k_2 < \cdots < k_n \le k$ 

$$\min_{1 \le j \le n} \angle (\ell, \ell_{kj}) < \frac{\pi}{2} - \varepsilon$$

*Proof.* Let  $x_j \in \mathbb{R}^n$ ,  $||x_j|| = 1$  ( $||\cdot||$  is the norm in  $\mathbb{R}^n$ ,  $j = 1, \ldots, n$ ) be the direction vector of the straight line  $\ell_j$ . If we assume the contrary to the assertion of the lemma, then for every  $m \in \mathbb{N}$  there exist  $y_m \in \mathbb{R}^n$ ,  $||y_m|| = 1$ , and numbers  $1 \leq k_1(m) < k_2(m) < \cdots k_n(m) \leq k$  such that

$$\operatorname{arccos}\left|(y_m, x_{k_j(m)})\right| > \frac{\pi}{2} - \frac{1}{m}$$

for j = 1, ..., n, where  $(\cdot, \cdot)$  is the scalar product in  $\mathbb{R}^n$ . Hence by the compactness of the unit sphere in  $\mathbb{R}^n$  and the continuity of the scalar product there exist  $y \in \mathbb{R}^n$ , ||y|| = 1, and  $1 \le k_1 < k_2 < \cdots < k_n \le k$  such that

$$(y, x_{k_i}) = 0$$

for j = 1, ..., n. This implies that the points  $x_{k_1}, ..., x_{k_n}$  belong to the hyperplane which is orthogonal to y. Thus the straight lines  $\ell_{k_1}, ..., \ell_{k_n}$  lie in the same hyperplane which contradicts the condition of the lemma.  $\Box$ 

**Lemma 4.** Let f be a continuous function on  $\mathbb{R}^n$ ,  $\theta \in \theta(\mathbb{R}^n)$ ,  $\lambda > 0$ , and an open set G contain  $\{M_{B_2(\theta)}(f) > \lambda\}$ . If for the rectangle I in  $\mathbb{R}^n$ with  $\theta(I) = \theta$ ,  $I \setminus G \neq \emptyset$ , then

$$\int\limits_{I\cap G}|f|\leq \lambda |I\cap G|.$$

*Proof.* We prove the lemma by induction with respect to n. For n = 1 the proof is obvious. Consider the passage from n-1 to n.

Without loss of generality we assume that  $\theta = \theta_0$  and I is closed. Introduce the notation:

$$\Gamma_{t} = \left\{ x \in \mathbb{R}^{n} : x^{1} = t \right\}, \\
I_{t} = I \cap \Gamma_{t}, \quad G_{t} = G \cap \Gamma_{t}, \\
J = \left\{ t \in \mathbb{R}^{n} : I_{t} \neq \varnothing \right\}, \\
S_{1} = \left\{ t \in J : I_{t} \subset G_{t} \right\}, \\
S_{2} = \left\{ t \in J : I_{t} \setminus G_{t} \neq \varnothing \right\}.$$
( $t \in \mathbb{R}$ )

It is easy to see that  $S_1$  is open by the natural topology on the interval J. Therefore  $S_1$  divides into pairwise nonintersecting intervals  $\{\delta_k\}_{k \in T \subset \mathbb{N}}$ . Obviously, the *n*-dimensional rectangles  $\Delta_k = \bigcup_{t \in \delta_k} I_t$   $(k \in T)$  satisfy the conditions

$$\partial \Delta_k \cap \partial G \neq \emptyset \quad (k \in T),$$
(3.6)

where  $\partial \Delta_k$  and  $\partial G$  are the boundaries of  $\Delta_k$  and G, respectively;

$$\theta(\Delta_k) = \theta(I) = \theta_0 \quad \text{and} \quad \Delta_k \subset I \cap G \quad (k \in T),$$
(3.7)

$$\Delta_k \cap \Delta_m = \emptyset \quad (k \neq m). \tag{3.8}$$

By the conditions of the lemma,  $M_{B_2}(f)(x) \leq \lambda$  for  $x \in \partial G$  and therefore, with (3.6) and (3.7) taken into account, we have

$$\int_{\Delta_k} |f| \le \lambda |\Delta_k| \quad (k \in T),$$

which on account to (3.8) implies

$$\int_{\substack{\bigcup\\k\in T}} |f| \le \lambda \Big| \bigcup_{k\in T} \Delta_k \Big|.$$
(3.9)

Estimate now the integral of |f| on  $(I \cap G) \setminus \bigcup_{k \in T} \Delta_k$ . Let M be an (n-1)dimensional strong maximal operator. For each  $t \in \mathbb{R}$  consider the function  $g_t(y) = f(t, y) \ (y \in \mathbb{R}^{n-1})$  and assume that

$$F(t,y) = M(g_t)(y) \quad (t \in \mathbb{R}, \quad y \in \mathbb{R}^{n-1}).$$

For  $t \in S_2$  we have

$$\left\{F(t,\cdot) > \lambda\right\} \subset G_t. \tag{3.10}$$

Indeed, assume the contrary, i.e., there exist  $t_0 \in S_2$ ,  $y_0 \in \mathbb{R}^{n-1}$  and an (n-1)-dimensional interval R such that  $(t_0, y_0) \notin G_{t_0}, R \ni y_0$ , and

$$\int\limits_{R} |g_{t_0}(y)| \, dy \ge \lambda |R|_{n-1}.$$

Then by the continuity of f, for a sufficiently small one-dimensional interval  $\Delta \ni t_0$  we shall have

$$\int_{\Delta \times R} |f(t,y)| \, dt \, dy > \lambda |\Delta \times R|$$

Hence  $M_{B_2}(f)(t_0, y_0) > \lambda$ . On the other hand, since  $(t_0, y_0) \notin G_{t_0}$ , we have  $(t_0, y_0) \notin \overline{G} \supset \{M_{B_2}(f) > \lambda\}$ . The obtained contradiction proves (3.10). By virtue of (3.10) and the induction assumption we easily obtain

By virtue of 
$$(3.10)$$
 and the induction assumption we easily obtain

$$\int_{I_t \cap G_t} |f(t,y)| \, dy \le \lambda |I_t \cap G_t|_{n-1}$$

for  $t \in S_2$ .

Thus we can immediately write

$$\int_{I\cap G\setminus \bigcup_{k\in T} \Delta_k} |f| = \int_{S_2} \left[ \int_{I_t\cap G_t} |f(t,y)| \, dy \right] dt \le \\ \le \int_{S_2} \lambda |I_t \cap G_t| \, dt = \lambda \Big| (I\cap G) \backslash \bigcup_{k\in T} \Delta_k \Big|.$$

whence by (3.7) and (3.9) we conclude that Lemma 4 is valid.  $\Box$ 

Denote by  $\overline{L}(\mathbb{R}^n)$  a class of all functions  $f \in L(\mathbb{R}^n)$  for each of which there exists, for  $\varepsilon > 0$ , a continuous function  $g \in L(\mathbb{R}^n)$  on  $\mathbb{R}^n$  such that  $|g(x)| \leq |f(x)|$  almost everywhere on  $\mathbb{R}^n$ , and  $||f - g||_1 < \varepsilon$ .

**Lemma 5.** Let  $f \in \overline{L}(\mathbb{R}^n)$ ,  $\theta \in \theta(\mathbb{R}^n)$ ,  $\lambda > 0$ , and then open set G contain  $\{M_{B_2(\theta)}(f) > \lambda\}$ . If for the rectangle I in  $\mathbb{R}^n$  with  $\theta(I) = \theta$ ,  $I \setminus G \neq \emptyset$ , then

$$\int_{I\cap G} |f| \le \lambda |I\cap G|$$

*Proof.*  $f \in \overline{L}(\mathbb{R}^n)$ . Therefore for arbitrarily given  $\varepsilon > 0$  there exists a continuous function  $g \in L(\mathbb{R}^n)$  on  $\mathbb{R}^n$  such that  $|g(x)| \leq |f(x)|$  almost everywhere on  $\mathbb{R}^n$ , and  $||f - g||_1 < \varepsilon$ . It is obvious that

$$\left\{M_{B_2(\theta)}(g) > \lambda\right\} \subset \left\{M_{B_2(\theta)}(f) > \lambda\right\} \subset G.$$

Now by Lemma 4

$$\int_{I\cap G} |g| \le \lambda |I\cap G|,$$

and therefore

$$\int\limits_{I\cap G}|f|-\varepsilon\leq\lambda|I\cap G|,$$

whence by the arbitrariness of  $\varepsilon > 0$  we conclude that Lemma 5 is valid.  $\Box$ 

**Lemma 6.** Let  $f_k \in \overline{L}(\mathbb{R}^n)$ ,  $f_k \ge 0$   $(k \in \mathbb{N})$ ,  $E \subset \theta(\mathbb{R}^n)$ ,  $E \ne \emptyset$ ,  $\lambda > 0$ , and let for  $k, m \in \mathbb{N}$  and  $k \ne m$  the following conditions be fulfilled:

$$\begin{aligned} \sup f_k \cap \sup f_m &= \varnothing, \\ \sup f_k \cap \left\{ M_{B_2(E)}(f_m) > \lambda \right\} &= \varnothing, \\ \left\{ M_{B_2(E)}(f_k) > \lambda \right\} \cap \left\{ M_{B_2(E)}(f_m) > \lambda \right\} &= \varnothing. \end{aligned}$$

Then

$$\left\{M_{B_2(E)}\left(\sum_{k=1}^m f_k\right) > \lambda\right\} = \bigcup_{k=1}^\infty \left\{M_{B_2(E)}(f_k) > \lambda\right\}.$$

*Proof.* Denote  $G_k = \{M_{B_2(E)}(f_k) > \lambda\}, k \in \mathbb{N}$ . For each  $k \in \mathbb{N}$ 

$$f_k(x) \le \lambda$$
 almost everywhere on  $\mathbb{R}^n \setminus G_k$ . (3.11)

Indeed, otherwise, since the differential bases  $B_2(\theta)$ ,  $\theta \in \theta(\mathbb{R}^n)$ , are dense (see, for e.g., [2], Ch.II, §3), for arbitrary  $\theta \in E$  and  $A_j = (\mathbb{R}^n \setminus G_k) \cap \{f_k > \lambda + 1/j\}$   $(j \in \mathbb{N})$  we shall have

$$\lim_{I \in B_2(\theta)(x), \text{ diam } I \to 0} \frac{|I \cap A_j|}{|I|} \quad \text{for almost all} \quad x \in A_j.$$

Hence  $M_{B_2(E)}(f_k) \ge M_{B_2(\theta)}(f_k) > \lambda$  for almost all  $x \in (\mathbb{R}^n \setminus G_k) \cap \{f_k > \lambda\}$ , which contradicts the definition of  $G_k$ .

By (3.11) and the condition of the lemma we write

$$\sum_{k=1}^{\infty} f_k(x) \le \lambda \quad \text{for almost all} \quad x \notin \bigcup_{k=1}^{\infty} G_k.$$

Hence, by the conditions of the lemma and by Lemma 5, we find that for every  $x \notin \bigcup_{k=1}^{\infty} G_k$  and  $I \in B_2(E)(x)$ 

$$\begin{split} \int_{I} \sum_{k=1}^{\infty} f_k &\leq \sum_{k=1}^{\infty} \int_{I \cap G_k} f_k + \int_{I \setminus \bigcup_{k=1}^{\infty} G_k} \sum_{k=1}^{\infty} f_k \leq \\ &\leq \sum_{k=1}^{\infty} \lambda |I \cap G_k| + \lambda \Big| I \setminus \bigcup_{k=1}^{\infty} G_k \Big| = \lambda |I|. \end{split}$$

Therefore

$$M_{B_2(E)}\Big(\sum_{k=1}^{\infty} f_k\Big)(x) \le \lambda \quad \text{for} \quad x \notin \bigcup_{k=1}^{\infty} G_k. \quad \Box$$

The next assertion belongs to Jessen, Marcinkiewicz, and Zygmund and is referred to as the strong maximal theorem (see [3] or [2], Ch. II, §3).

**Theorem.** If  $f \in L(1 + \ln^+ L)^{n-1}(\mathbb{R}^n)$ , then

$$\left|\left\{M_{B_2}(f) > \lambda\right\}\right| \le c_1 \int_{\mathbb{R}^n} \frac{|f|}{\lambda} \left(1 + \ln^+ \frac{|f|}{\lambda}\right)^{n-1} \quad (\lambda > 0),$$

where  $c_1$  is the constant depending only on n.

The foollowing lemma is a simple improvement of this result.

**Lemma 7.** If  $f \in L(1 + \ln^+ L)^{n-1}(\mathbb{R}^n)$ , then for every  $\theta \in \theta(\mathbb{R}^n)$ 

$$\left|\left\{M_{B_2(\theta)}(f) > \lambda\right\}\right| \le c_2 \int_{\{|f| > \lambda/2\}} \frac{|f|}{\lambda} \left(1 + \ln \frac{2|f|}{\lambda}\right)^{n-1} \quad (\lambda > 0),$$

where the constant  $c_2$  depends only on n.

*Proof.* For arbitrary fixed  $\lambda > 0$  assume  $f_* = f \chi_{\{|f| \le \lambda/2\}}$  and  $f^* = f \chi_{\{|f| > \lambda/2\}}$ .  $f = f_* + f^*$ . Therefore  $M_{B_2}(f) \le M_{B_2}(f_*) + M_{B_2}(f^*)$ . Hence

$$\{M_{B_2} > \lambda\} \subset \{M_{B_2}(f_*) > \lambda/2\} \cup \{M_{B_2}(f^*) > \lambda/2\}$$

But  $\{M_{B_2}(f_*) > \lambda/2\} = \emptyset$  and therefore by the strong maximal theorem

$$\left|\left\{M_{B_{2}}(f) > \lambda\right\}\right| \leq \left|\left\{M_{B_{2}}(f^{*}) > \lambda/2\right\}\right| \leq c_{1} \int_{\mathbb{R}^{n}} \frac{2|f^{*}|}{\lambda} \left(1 + \ln^{+} \frac{2|f^{*}|}{\lambda}\right)^{n-1} \leq \\ \leq 2c_{1} \int_{\{|f| > \lambda/2\}} \frac{|f|}{\lambda} \left(1 + \ln \frac{2|f|}{\lambda}\right)^{n-1}.$$
(3.12)

Let  $\gamma_{\theta}, \theta \in \theta(\mathbb{R}^n)$ , be a rotation such that  $\theta = \{\gamma_{\theta}(Ox^1), \ldots, \gamma_{\theta}(Ox^n)\}$ . In view of the fact that the rotation is a measure preserving mapping, we readily obtain

$$M_{B_2(\theta)}(f)(x) = M_{B_2}(f \circ \gamma_{\theta}) \left(\gamma_{\theta}^{-1}(x)\right) \quad (x \in \mathbb{R}^n)$$
(3.13)

Therefore

$$\left|\left\{M_{B_2(\theta)}(f) > \lambda\right\}\right| = \left|\left\{M_{B_2}(f \circ \gamma_\theta) > \lambda\right\}\right| \quad (\lambda > 0).$$

By this and (3.12) we conclude that the lemma is valid.  $\Box$ 

**Lemma 8.** If  $f \in L(1 + \ln^+ L)^n(\mathbb{R}^n)$ , then for every  $\theta \in \theta(\mathbb{R}^n)$ 

where the constant  $c_3$  depends only on n.

*Proof.* Let  $f \in L(1 + \ln^+ L)^n(\mathbb{R}^n)$  and  $\lambda > 0$ . We have

$$\int_{\{M_{B_2}(\theta)(f)>\lambda\}} M_{B_2}(f) = -\int_{\lambda}^{\infty} t \, dF(t) = \left[-tF(t)\right]_{\lambda}^{\infty} + \int_{\lambda}^{\infty} F(t) \, dt$$

where  $F(t) = |\{M_{B_2}(f) > t\}|$  (t > 0). By Lemma 7

$$tF(t) \le c_2 \int_{\{|f| > t/2\}} |f| \left(1 + \ln \frac{2|f|}{t}\right)^{n-1} \quad (t > 0).$$
(3.14)

Hence

$$\int_{\{M_{B_2}(\theta)(f)>\lambda\}} M_{B_2}(f) = \lambda F(\lambda) + \int_{\lambda}^{\infty} F(t) dt.$$
(3.15)

Lemma 7 yields

$$\int_{\lambda}^{\infty} F(t) dt \le c_2 \int_{\lambda}^{\infty} \int_{\{|f(x)| > t/2\}} \frac{|f(x)|}{t} \left(1 + \ln \frac{2|f(x)|}{t}\right)^{n-1} dx dt =$$

$$= c_2 \int_{\{|f(x)| > \lambda/2\}} \int_{\lambda}^{2|f(x)|} \frac{|f(x)|}{t} \left(1 + \ln \frac{2|f(x)|}{t}\right)^{n-1} dt dx \le$$

$$\le c_2 \int_{\{|f(x)| > \lambda/2\}} \int_{\lambda}^{2|f(x)|} \frac{|f(x)|}{t} \left(1 + \ln \frac{2|f(x)|}{\lambda}\right)^{n-1} dt dx \le$$

$$\le c_2 \int_{\{|f(x)| > \lambda/2\}} |f(x)| \left(1 + \ln \frac{2|f(x)|}{\lambda}\right)^n dx,$$

whence with regard for (3.14) and (3.15) we obtain

$$\int_{\{M_{B_2}(f)>\lambda\}} M_{B_2}(f) \le 2c_2 \int_{\mathbb{R}^n} |f| \left(1 + \ln^+ \frac{2|f|}{\lambda}\right)^n \quad (\lambda > 0)$$
(3.16)

for  $f \in L(1 + \ln^+ L)^n(\mathbb{R}^n)$ . (3.13) readily implies

$$\int_{\{M_{B_2(\theta)}(f)>\lambda\}} M_{B_2(\theta)}(f) = \int_{\{M_{B_2}(f \circ \gamma_\theta)>\lambda\}} M_{B_2}(f \circ \gamma_\theta) \quad (\lambda > 0) \quad (3.17)$$

for  $f \in L(1 + \ln^+ L)^n(\mathbb{R}^n)$  and  $\theta \in \theta(\mathbb{R}^n)$ .

Since the rotation is the measure preserving mapping, by (3.16) and (3.17) we immediately conclude that Lemma 8 is valid.  $\Box$ 

**Lemma 9.** Let  $f \in L(1 + \ln^+ L)(\mathbb{R}^n)$ ,  $g : \mathbb{R}^n \to \mathbb{R}$  be a measurable function, and a, b > 0 and  $\lambda \ge 0$ . If

$$\left|\left\{|g|>t\right\}\right| \le \frac{a}{t} \int_{\{|f|>bt\}} |f| \quad (t \ge \lambda), \tag{3.18}$$

then

$$\int_{\{|g|>\lambda\}} |g| \le a \int_{\mathbb{R}^n} |f| \left(1 + \ln^+ \frac{|f|}{b\lambda}\right).$$

*Proof.* We have

$$\int_{\{|g|>\lambda\}} |g| = -\int_{\lambda}^{\infty} t \, dF(t) = \left[-tF(t)\right]_{\lambda}^{\infty} + \int_{\lambda}^{\infty} F(t) \, dt,$$

where  $F(t) = |\{|g| > t\}|$   $(t \ge 0)$ . By (3.18)

$$tF(t) \le a \int_{\{|f| > bt\}} |f| \quad (t \ge \lambda).$$
(3.19)

Hence

$$\int_{\{|g|>\lambda\}} |g| = \lambda F(\lambda) + \int_{\lambda}^{\infty} F(t) dt.$$
(3.20)

By (3.18)

$$\begin{split} & \int_{\lambda}^{\infty} F(t) \, dt \leq a \int_{\lambda}^{\infty} \frac{1}{t} \int_{\{|f(x)| > bt\}} |f(x)| \, dx \, dt = \\ & = a \int_{\{|f(x)| > b\lambda\}} |f(x)| \int_{\lambda}^{|f(x)|/b} \frac{dt}{t} \, dx = a \int_{\{|f(x)| > b\lambda\}} |f(x)| \ln \frac{|f(x)|}{b\lambda} \, dx. \end{split}$$

Hence with (3.19) and (3.20) taken into account, we conclude that Lemma 9 is valid.  $\hfill\square$ 

**Lemma 10.** Let  $f_1$  and  $f_2$  be the nonnegative measurable functions defined on  $\mathbb{R}^n$ . Then

$$\int_{\{f_1+f_2>2\lambda\}} (f_1+f_2) \le (1+\lambda) \left( \int_{\{f_1>\lambda\}} f_1 + \int_{\{f_2>\lambda\}} f_2 \right) \quad (\lambda \ge 0).$$

*Proof.* The validity of the lemma follows from the following relations easy to verify:

$$(1) \int_{\{f_1+f_2>2\lambda\}} (f_1+f_2) \leq \int_{\{f_1>\lambda\}\cup\{f_2>\lambda\}} (f_1+f_2);$$

$$(2) \int_{\{f_1>\lambda\}\cup\{f_2>\lambda\}} f_j \leq \int_{\{f_j>\lambda\}} f_j + \lambda|\{f_i>\lambda\}|, \text{ where } j, i \in \overline{1,2} \text{ and } j \neq i. \quad \Box$$

The set  $E \subset \mathbb{R}^n$  is called elementary if it is a union of a finite number of *n*-dimensional intervals.

**Lemma 11.** Let A be a subset of  $\mathbb{R}^n$  of positive measure. Then for each  $\delta_k > 0$   $(k \in \mathbb{N})$  with  $\sum_{k=1}^{\infty} \delta_k < |A|$  and  $\varepsilon_k > 0$   $(k \in \mathbb{N})$  there exist pairwise nonintersecting elementary sets  $G_k$   $(k \in \mathbb{N})$  such that

 $|G_k| = \delta_k$  and  $|G_k \setminus A| < \varepsilon_k$ .

*Proof.* Let us construct the sequence  $\{G_k\}$  with the needed properties. For this we shall need the following simple facts:

(1) For each measurable set E and number  $\delta$  with  $0 \leq \delta \leq |E|$  there exists a measurable set  $E' \subset E$  with  $|E'| = \delta$ ;

(2) For each open set  $E \subset \mathbb{R}^n$  and number  $\delta$  with  $0 < \delta < |E|$  there exists an elementary set  $E' \subset E$  with  $|E'| = \delta$ .

By virtue of (1), there exists  $E \subset A$  with  $|E| = \delta_1$ . Let an open set Q be such that  $Q \supset E$ ,  $|Q| > |E| = \delta_1$  and  $|Q \setminus E| < \varepsilon_1$ . According to (2), there exists an elementary set  $G_1 \subset Q$  with  $|G_1| = \delta_1$ . Obviously,  $|G_1 \setminus A| \le |Q \setminus E| < \varepsilon_1$ .

Suppose the pairwise nonintersecting elementary sets  $G_1, \ldots, G_k$  with the properties

$$|G_j| = \delta_j$$
 and  $|G_j \setminus A| < \varepsilon_j$   $(j \in \overline{1, k})$ 

have already been constructed. Then

$$\left|A \setminus \bigcup_{j=1}^{k} (\overline{G}_j \cap A)\right| \ge |A| - \sum_{j=1}^{k} \delta_j > \delta_{k+1},$$

where  $\overline{G}_j$  is the closure of  $G_j$ . Therefore by (1), there exists

$$E \subset A \backslash \bigcup_{j=1}^{k} (\overline{G}_j \cap A)$$

with  $|E| = \delta_{k+1}$ . We can easily obtain an open set  $Q \supset E$  with the properties

$$Q \cap \bigcup_{j=1}^{\kappa} \overline{G}_j = \emptyset, \quad |Q| > |E| = \delta_{k+1}, \quad |Q \setminus E| < \varepsilon_{k+1}.$$

By (2), we can choose an elementary set  $G_{k+1} \subset Q$  such that  $|G_{k+1}| = \delta_{k+1}$ . By virtue of the properties of Q we have

$$|G_{k+1} \setminus A| \le |Q \setminus E| < \varepsilon_{k+1}$$
$$G_{k+1} \cap \bigcup_{j=1}^{k} G_j = \emptyset,$$

which obviously proves Lemma 11.  $\Box$ 

We shall need the following simple lemma (see [2], Ch. III,  $\S1$ ).

**Lemma 12.** Let G be an open bounded set in  $\mathbb{R}^n$ , and K be a compact set in  $\mathbb{R}^n$  with |K| > 0. Then there exists a sequence  $\{K_k\}$  of pairwise nonintersecting sets, homothetic to K, contained in G and such that  $|G \setminus \bigcup K_k| = 0$ .

We shall also need the following well-known fact from the measure theory (see, e.g., [9], Ch. "Uniform Approximation").

**Lemma 13.** For every measurable sets  $A_1, A_2 \subset \mathbb{R}^n$ ,  $|A_1| = |A_2|$ , there exists a measure preserving and invertible mapping  $\omega : A_1 \to A_2$ .

## 4. Proof of Theorem 1

Without loss of generality we assume that  $f \ge 0$  and  $f \notin (1+\ln^+ L)^n (\mathbb{R}^n)$ . Denote

$$G = \operatorname{supp} f, \quad A_k = \{k - 1 \le f < k\} \ (k \in \mathbb{N}),$$
$$k_0 = \min\left\{k \ge 2 : \sum_{m=k}^{\infty} 9^m m |A_m| < |G|\right\},$$
$$N = \{k \ge k_0 : |A_k| > 0\}.$$

Choose natural numbers  $m_k \ge n \ (k \in N)$  such that

$$\sum_{k \in N} \frac{k(\ln k)^n |A_k|}{m_k} < 1.$$
(4.1)

For  $k \in N$ , let  $\ell_{k,1}, \ldots, \ell_{k,m_k}$  be the straight lines passing through the origin with none of n lying in the same hyperplane. Then by Lemma 2 there exists  $\varepsilon_k > 0$  such that

$$\min_{1 \le j \le n} \angle (\ell, \ell_{k,\nu_j}) < \frac{\pi}{2} - \varepsilon_k \tag{4.2}$$

for every  $1 \le \nu_1 < \nu_2 < \cdots < \nu_n \le m_k$  and for every straight line  $\ell$ .

For every  $k \in N$  and  $m \in \overline{1, m_k}$  let us consider the rectangle  $I_{k,m}$  with the properties:

$$r(I_{k,m}) \ge \frac{4kn}{\sin \varepsilon_k}, \quad |I_{k,m}| = \frac{|A_k|}{m_k}, \quad \ell_{I_{k,m}} = \ell_{k,m}.$$
 (4.3)

Denote  $J_{k,m} = J(I_{k,m}, 4k), E_{k,m} = E(\ell_{k,m}, \varepsilon_k) \ (k \in N, m \in \overline{1, m_k}).$  By Lemma 2

$$\{M_{B_2(E_{k,m})}(4k\chi_{I_{k,m}}) > 1\} \subset J_{k,m}.$$

From the definition of  $k_0$  and  $J_{k,m}$  and from (4.3), we conclude by virtue of Lemma 11 that there exist pairwise nonintersecting open sets  $Q_{k,m}$  such that

$$Q_{k,m}| = |J_{k,m}|$$
 and  $|Q_{k,m} \setminus G| < \frac{1}{2^k m_k}$ .

For each  $k \in N$  and  $m \in \overline{1, m_k}$  we complete  $Q_{k,m}$  with pairwise nonintersecting rectangles  $\{J_{k,m,q}\}$  which are homothetic to the rectangle  $J_{k,m}$ (see Lemma 12), i.e.,

$$\begin{aligned} J_{k,m,q} &= H_{k,m,q}(J_{k,m}), & \text{where } H_{k,m,q} \text{ is the homothety } (q \in \mathbb{N}), \\ J_{k,m,q} &\subset Q_{k,m} \quad (q \in \mathbb{N}), \\ J_{k,m,q} &\cap J_{k,m,q'} = \varnothing \quad (q \neq q'), \\ \left| Q_{k,m} \setminus \bigcup_{q \in \mathbb{N}} J_{k,m,q} \right| = 0. \end{aligned}$$

Let  $I_{k,m,q} = H_{k,m,q}(I_{k,m})$   $(k \in N, m \in \overline{1, m_k}, q \in \mathbb{N})$ . Because of the homothety properties we can easily see that

$$J_{k,m,q} = J(I_{k,m,q}, 4k), (4.4)$$

$$\{M_{B_2(E_{k,m})}(4k\chi_{I_{k,m,q}}) > 1\} \subset J_{k,m,q}$$
(4.5)

for  $k \in N$ ,  $m \in \overline{1, m_k}$ ,  $q \in \mathbb{N}$ , and

$$\sum_{q \in \mathbb{N}} |I_{k,m,q}| = |I_{k,m}| = \frac{|A_k|}{m_k}$$
(4.6)

for  $k \in N$ ,  $m \in \overline{1, m_k}$ .

Denote

$$\begin{split} g_{k,m} &= \sup \left\{ k \chi_{I_{k,m,q}} : q \in \mathbb{N} \right\} \quad (k \in N, \ m \in \overline{1, m_k}), \\ g &= \sup \left\{ g_{k,m} : k \in N, \ m \in \overline{1, m_k} \right\}, \end{split}$$

and prove that

$$\sup_{\theta \in \theta(\mathbb{R}^n)} \int_{\{M_{B_2(\theta)}(g) > 1/2\}} M_{B_2(\theta)}(g) < \infty.$$

$$(4.7)$$

The following estimate is valid:

card 
$$S_{\theta,k} < n^2 \quad (\theta \in \theta(\mathbb{R}^n), \quad k \in N),$$
 (4.8)

where  $S_{\theta,k} = \{m \in \overline{1, m_k} : \theta \notin E_{k,m}\}$ . Indeed, let us assume the contrary, i.e., that  $\operatorname{card} S_{\theta,k} \geq n^2$  for some  $\theta \in \theta(\mathbb{R}^n)$  and  $k \in N$ . Then there exist  $1 \leq \nu_1 < \cdots < \nu_{n^2} \leq m_k$  such that  $\theta \in E_{k,\nu_j}$   $(j \in \overline{1, n^2})$ , i.e.,  $\max_{1 \leq i \leq n} \angle (\theta^i, \ell_{k,\nu_j}) \geq \frac{\pi}{2} - \varepsilon_k$   $(j \in \overline{1, n^2})$ . Hence there exist a straight line  $\theta^i \in \theta$  and indices  $\nu'_1, \ldots, \nu'_n \in \{\nu_1, \ldots, \nu_{n^2}\}$  such that  $\angle (\theta^i, \ell_{k,\nu'_j}) \geq \frac{\pi}{2} - \varepsilon_k$  $(j \in \overline{1, n})$ , which contradicts (4.2). Therefore (4.8) is proved.

Let us consider an arbitrary frame  $\theta$ . Suppose

$$g_{\theta} = \begin{cases} \sup\{g_{k,m} : k \in N, \ m \in S_{\theta,k}\} & \text{if } \bigcup_{k \in N} S_{\theta,k} \neq \varnothing, \\ 0 & \text{if } \bigcup_{k \in N} S_{\theta,k} = \varnothing. \end{cases}$$

By Lemma 8, (4.1), (4.3), (4.6) and (4.8) we have

$$\int_{\{M_{\mathbf{I}(\theta)}(g_{\theta})>1/4\}} M_{\mathbf{I}(\theta)}(g_{\theta}) \le c_3 \int_{\mathbb{R}^n} g_{\theta} (1+\ln^+ 4g_{\theta})^n < c_3 \sum_{k \in \mathbb{N}} n^2 k (1+\ln 4k)^n \frac{|A_k|}{m_k} < 5^n n^2 c_3 \sum_{k \in \mathbb{N}} \frac{k(\ln k)^n |A_k|}{m_k} < 5^n n^2 c_3.$$
(4.9)

Denote

$$T = \left\{ (k, m, q) : k \in N, \ m \in \overline{1, m_k} \setminus S_{\theta, k}, \ q \in \mathbb{N} \right\},$$
$$J_{k, m, q}(\lambda) = J(I_{k, m, q}, k/\lambda) \quad \text{for} \quad (k, m, q) \in T \text{ and } 1/4 \le \lambda < k.$$

Obviously,

$$r(I_{k,m,q}) > \frac{4kn}{\sin \varepsilon_k} \ge \frac{kn}{\lambda \sin \varepsilon_k}$$

for  $(k,m,q) \in T$  and  $1/4 \leq \lambda < k,$  whence on account of (4.4), (4.5) and Lemma 2

$$\left\{ M_{B_2(E_{k,m})}(k\chi_{I_{k,m,q}}) > \lambda \right\} =$$
$$= \left\{ M_{B_2(E_{k,m})}\left(\frac{k}{\lambda}\chi_{I_{k,m,q}}\right) > 1 \right\} \subset J_{k,m,q}(\lambda) \subset J_{k,m,q}.$$

Consequently, since  $\theta \in E_{k,m}$ , we have

$$\left\{M_{B_2(\theta)}(k\chi_{I_{k,m,q}}) > \lambda\right\} \subset J_{k,m,q}(\lambda) \subset J_{k,m,q}.$$
(4.10)

On the other hand, it is clear that

$$\left\{M_{B_2(\theta)}(k\chi_{I_{k,m,q}}) > \lambda\right\} = \emptyset \tag{4.11}$$

for  $(k, m, q) \in T$  and  $\lambda \geq k$ .

It is easy to see that the functions  $k\chi_{I_{k,m,q}}$  belong to the class  $\overline{L}(\mathbb{R}^n)$  and therefore, keeping in mind that the rectangles  $J_{k,m,q}$  are pairwise nonintersecting and using (4.10), (4.11) and Lemma 6 we have

$$\left\{M_{B_2(\theta)}(g-g_\theta)>\lambda\right\}\subset \bigcup_{(k,m,q)\in T,\ k>\lambda}J_{k,m,q}(\lambda)\quad\text{for}\quad\lambda\geq 1/4.$$

The above inequality, (4.3), (4.6) and the definition of g imply that

$$\left|\left\{M_{B_2(\theta)}(g-g_{\theta}) > \lambda\right\}\right| \le \sum_{(k,m,q)\in T, \ k>\lambda} |J_{k,m,q}(\lambda)| \le \\ \le \sum_{k\in N, \ k>\lambda} \sum_{m=1}^{m_k} \sum_{q=1}^{\infty} 9^n \frac{k}{\lambda} |I_{k,m,q}| = \frac{9^n}{\lambda} \sum_{k\in N, \ k>\lambda} k|A_k| \le \frac{2\cdot 9^n}{\lambda} \int_{\{f>\lambda/2\}} f_{f>\lambda/2}$$

for  $\lambda \geq 1/4$ .

{

Consequently, by Lemma 9 we obtain

$$\int_{M_{B_2(\theta)}(g-g_{\theta}) > 1/4} M_{B_2(\theta)}(g-g_{\theta}) \le 2 \cdot 9^n \int_{\mathbb{R}^n} f(1+\ln^+ 8f).$$
(4.12)

From (4.9), (4.12) and Lemma 10 we find that

$$\int_{\{M_{B_2(\theta)}(g)>1/2\}} M_{B_2(\theta)}(g) < 2 \cdot 5^n n^2 c_3 + 4 \cdot 9^n \int_{\mathbb{R}^n} f(1 + \ln^+ 8f),$$

whence by virtue of the arbitrariness of  $\theta$  we conclude that (4.7) is valid. Denote

$$P_k = \bigcup_{m=1}^{m_k} \bigcup_{q=1}^{\infty} (I_{k,m,q} \cap G) \quad (k \in N).$$

By our choice of sets  $Q_{k,m}$  we easily see that

$$0 \le |A_k| - |P_k| < \frac{1}{2^k} \quad (k \in N).$$
(4.13)

Let  $A'_k \subset A_k$   $(k \in N)$  be some measurable set with  $|A'_k| = |P_k|$ . By Lemma 13 there exists a measure preserving and invertible mapping  $\omega$ :  $\mathbb{R}^n \to \mathbb{R}^n$  such that

$$\omega(P_k) = A'_k \quad (k \in N), \quad \omega\left(G \setminus \bigcup_{k \in N} P_k\right) = G \setminus \bigcup_{k \in N} A'_k,$$
$$\omega(x) = x \quad (x \in \mathbb{R}^n \backslash G). \tag{4.14}$$

Suppose

$$\varphi_1 = (f \circ \omega) \chi_{\bigcup_{k \in N} P_k} \quad \text{and} \quad \varphi_2 = (f \circ \omega) \chi_{\mathbb{R}^n \setminus \bigcup_{k \in N} P_k}.$$

Obviously,  $f \circ \omega = \varphi_1 + \varphi_2$ . We have

$$\int_{\mathbb{R}^n} \varphi_2 (1 + \ln^+ \varphi_2)^n = \int_{\mathbb{R}^n \setminus \bigcup_{k \in N} A'_k} f(1 + \ln^+ f)^n =$$

$$= \int_{\{0 \le f < k_0 - 1\}} f(1 + \ln^+ f)^n + \sum_{k \in N} \int_{A_k \setminus A'_k} f(1 + \ln^+ f)^n = \alpha_1 + \alpha_2.$$

It can be seen that  $\alpha_1 < \infty$ , and by (4.13)

$$\alpha_2 \le \sum_{k \in N} \frac{k(1 + \ln k)^n}{2^k} < \infty$$

Thus  $\varphi_2 \in L(1 + \ln^+ L)^n(\mathbb{R}^n)$ . Therefore, by the obvious inequality  $\varphi_1 \leq g$ , (4.7) and Lemmas 8 and 10, we conclude that

$$\sup_{\theta\in \theta(\mathbb{R}^n)} \int_{\{M_{B_2(\theta)}(f\circ\omega)>1\}} M_{B_2(\theta)}(f\circ\omega) < \infty,$$

which together with (4.14) completes the proof of Theorem 1.

### 5. Remarks

(1) By the equality  $M_{B_2(\theta)}(\alpha f) = \alpha M_{B_2(\theta)}(f)$  ( $\alpha > 0$ ), we can easily verify that Theorem 1 remains valid if instead of  $\{M_{B_2(\theta)}(f \circ \omega) > 1\}$  we shall take the integrals on  $\{M_{B_2(\theta)}(f \circ \omega) > \lambda\}$ , where  $\lambda > 0$  is an arbitrarily fixed number.

(2) Theorem 1 immediately yields the following improvement:

**Theorem 2.** For every function  $f \in L(1 + \ln^+ L)(\mathbb{R}^n)$   $(n \geq 2)$  and measurable sets  $G_1, G_2 \in \mathbb{R}^n$  such that  $f\chi_{\mathbb{R}^n \setminus G_1} \in L(1 + \ln^+ L)^n(\mathbb{R}^n)$  and  $|G_1| = |G_2|$  there exists a measure preserving and invertible mapping  $\omega : \mathbb{R}^n \to \mathbb{R}^n$  such that

1) 
$$\omega(G_1) = G_2$$
 and  $\{x : \omega(x) \neq x\} \subset G_1 \cup G_2,$   
2)  $\sup_{\theta \in \theta(\mathbb{R}^n)} \int_{\{M_{B_2(\theta)}(f \circ \omega) > 1\}} M_{B_2(\theta)}(f \circ \omega) < \infty.$ 

*Proof.* Let  $\omega_1 : \mathbb{R}^n \to \mathbb{R}^n$  be a measure preserving and invertible mapping such that (see Lemma 12)  $\omega_1(G_1) = G_2$  and  $\{x : \omega(x) \neq x\} \subset G_1 \cup G_2$ . Consider the function  $g = (f \circ \omega_1)\chi_{G_2}$ . Then  $\operatorname{supp} g \subset G_2$ , and by virtue of Theorem 1 (see Remark (1)) there exists a measure preserving and invertible mapping  $\omega_2 : \mathbb{R}^n \to \mathbb{R}^n$  such that

$$\{x: \omega_2(x) \neq x\} \subset \operatorname{supp} g \subset G_2 \text{ and } \sup_{\theta \in \theta(\mathbb{R}^n)} \int_{\{M_{B_2(\theta)}(g \circ \omega_2) > 1/2\}} M_{B_2(\theta)}(g \circ \omega_2) < \infty.$$

Obviously,  $(f \circ \omega_1)\chi_{\mathbb{R}^n \setminus G_2} \in L(1 + \ln^+ L)^n(\mathbb{R}^n)$ . Therefore, by Lemmas 8 and 10, one can take  $\omega_2 \circ \omega_1$  as  $\omega$ .  $\Box$ 

(3) For arbitrary  $\varepsilon > 0$ , a mapping  $\omega$  "correcting" the function  $f \in L(1 + \ln^+ L)(\mathbb{R}^n)$  can be chosen so that

$$|\{f \circ \omega \neq f\}| < \varepsilon.$$

For this it is enough in Theorem 2 to take  $G_1$  and  $G_2$  with measures less than  $\varepsilon/2$ .

(4) When  $G_1 = \{|f| > 1\}$ , and  $G_2$  is a cubic interval, Theorem 2 has been proved for n = 2 in [7] and announced for  $n \ge 2$  in [8].
