Recommended by Onno Boxma

By means of the notion of likelihood ratio, the limit properties of the sequences of arbitrary-dependent continuous random variables are studied, and a kind of strong limit theorems represented by inequalities with random bounds for functions of continuous random variables is established. The Shannon-McMillan theorem is extended to the case of arbitrary continuous information sources. In the proof, an analytic technique, the tools of Laplace transform, and moment generating functions to study the strong limit theorems are applied.

1. Introduction

Let $\{X_n, n \geq 1\}$ be a sequence of arbitrary continuous real random variables on the probability space (Ω, \mathcal{F}, P) with the joint density function

$$f_n(x_1, \dots, x_n) > 0, \quad n = 1, 2, \dots, \quad (1.1)$$

where $x_i \in (-\infty, \infty)$, $1 \leq i \leq n$. Let Q be another probability measure on \mathcal{F} , and $\{X_n, n \geq 1\}$ is a sequence of independent random variables on the probability space (Ω, \mathcal{F}, Q) with the marginal density functions $g_k(x_k)$ ($1 \leq k \leq n$), and let

$$\pi_n(x_1, \dots, x_n) = \prod_{k=1}^n g_k(x_k). \quad (1.2)$$

In order to indicate the deviation between $\{X_n, n \geq 1\}$ on the probability measure P and Q , we first introduce the following definitions.

Definition 1.1. Let $\{X_n, n \geq 1\}$ be a sequence of random variables with joint distribution (1.1), and let $g_k(x_k)$ ($k = 1, 2, \dots, n$) be defined by (1.2). Let

$$Z_n(\omega) = \frac{f_n(X_1, \dots, X_n)}{\pi_n(X_1, \dots, X_n)}. \quad (1.3)$$

In statistical terms, $Z_n(\omega)$ is called the likelihood ratio, which is of fundamental importance in the theory of testing the statistical hypotheses (cf. [1, page 388]; [2, page 483]).

The random variable

$$r(\omega) = \limsup_{n \rightarrow \infty} \frac{1}{n} \ln Z_n(\omega) = -\liminf_{n \rightarrow \infty} \frac{1}{n} \ln \left[\left\{ \prod_{k=1}^n g_k(X_k) \right\} / f_n(X_1, \dots, X_n) \right] \quad (1.4)$$

is called asymptotic logarithmic likelihood ratio, relative to the product of marginal distribution of (1.2), of $X_n, n \geq 1$, where \ln is the natural logarithm, ω is the sample point. For the sake of brevity, we denote $X_k(\omega)$ by X_k .

Although $r(\omega)$ is not a proper metric between probability measures, we nevertheless think of it as a measure of "dissimilarity" between their joint distribution $f_n(x_1, \dots, x_n)$ and the product $\pi_n(x_1, \dots, x_n)$ of their marginals.

Obviously, $r(\omega) = 0$, a.s. if and only if $\{X_n, n \geq 1\}$ are independent.

A stochastic process of fundamental importance in the theory of testing hypotheses is the sequence of likelihood ratio. In view of the above discussion of the asymptotic logarithmic likelihood ratio, it is natural to think of $r(\omega)$ as a measure how far (the random deviation of) X_n is from being independent, how dependent they are. The smaller $r(\omega)$ is, the smaller the deviation is (cf. [3–5]).

In [3], the strong deviation theorems for discrete random variables were discussed by using the generating function method. Later, the approach of Laplace transform to study the strong limit theorems was first proposed by Liu [4]. Yang [6] further studied the limit properties for Markov chains indexed by a homogeneous tree through the analytic technique. Many comprehensive works may be found in Liu [7]. The purpose of this paper is to establish a kind of strong deviation theorems represented by inequalities with random bounds for functions of arbitrary continuous random variables, by combining the analytic technique with the method of Laplace transform, and to extend the strong deviation theorems to the differential entropy for arbitrary-dependent continuous information sources in more general settings.

Definition 1.2. Let $\{h_n(x_n), n \geq 1\}$ be a sequence of nonnegative \mathcal{B} or \mathcal{E} measurable functions defined on \mathcal{R} , the Laplace transform of random variables $h_n(X_n)$ on the probability space (Ω, \mathcal{F}, Q) is defined by

$$\tilde{f}_n(s) = \int_{-\infty}^{\infty} e^{-sh_n(x_n)} g_n(x_n) dx_n = E_Q e^{-sh_n(X_n)}, \quad n = 1, 2, \dots, \quad (1.5)$$

where E_Q denotes the expectation under Q .

We have the following assumptions in this paper.

(1) Assume that there exists $s_0 \in (0, \infty)$ such that

$$\tilde{f}_n(s) < \infty, \quad s \in [-s_0, s_0], \quad n = 1, 2, \dots \quad (1.6)$$

(2) Assume $M > 0$ is a constant, satisfying

$$\sup_n E_Q h_n(X_n) \leq M < \infty. \quad (1.7)$$

In order to prove our main results, we first give a lemma, and it will be shown that it plays a central role in the proofs.

Lemma 1.3. Let $f_n(x_1, \dots, x_n)$, $g_n(x_1, \dots, x_n)$ be two probability functions on (Ω, \mathcal{F}, P) , let

$$T_n(\omega) = \frac{g_n(X_1, \dots, X_n)}{f_n(X_1, \dots, X_n)}, \quad (1.8)$$

then

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \ln T_n(\omega) \leq 0 \quad a.s. \quad (1.9)$$

Proof. By [8], $\{T_n, \mathcal{F}, n \geq 1\}$ is a nonnegative martingale and $ET_n = 1$, we have by the Doob martingale convergence theorem, there exists an integral random variable $T_\infty(\omega)$, such that $T_n \rightarrow T_\infty$, a.s. and (1.9) follows. \square

2. Main results

Theorem 2.1. Let $\{X_n, n \geq 1\}$, $Z_n(\omega)$, $r(\omega)$, $\tilde{f}_n(s)$ be defined as before, and under the assumptions of (1) and (2), let

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n E_Q e^{s_0 h_k(X_k)} = \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n \tilde{f}_k(-s_0) = M(s_0) < \infty. \quad (2.1)$$

Then

$$\liminf_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \geq -\beta(r(\omega)), \quad a.s. \quad (2.2)$$

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \leq \beta(r(\omega)), \quad a.s. \quad (2.3)$$

where

$$\beta(x) = \inf \{ \phi(s, x), -s_0 < s < 0 \}, \quad x \geq 0, \quad (2.4)$$

$$\phi(s, x) = -\frac{2e^{-2s}M(s_0)}{(s_0 - |s|)^2} - \frac{x}{s}, \quad x \geq 0, \quad (2.5)$$

$$0 \leq \beta(x) \leq \frac{\sqrt{x}(1 + \sqrt{x})}{s_0} [2e^{-2}M(s_0) + 1], \quad \lim_{x \rightarrow 0^+} \beta(x) = \beta(0) = 0. \quad (2.6)$$

Remark 2.2. Let

$$\alpha(x) = \sup \{ \phi(s, x), 0 < s < s_0 \}, \quad x \geq 0, \quad (2.7)$$

then

$$\alpha(x) = -\beta(x). \quad (2.8)$$

Proof. Let s be an arbitrary real number in $(-s_0, s_0)$, let

$$g_n(s, x_n) = e^{-sh_n(x_n)} g_n(x_n) / \tilde{f}_n(s), \quad x_n \in (-\infty, \infty), \quad n = 1, 2, \dots, \quad (2.9)$$

then $\int_{-\infty}^{\infty} g_n(s, x_n) dx_n = 1$, and let

$$q_n(s; x_1, \dots, x_n) = \prod_{k=1}^n g_k(s, x_k). \quad (2.10)$$

Therefore, $q_n(s; x_1, \dots, x_n)$ is an n multivariate probability density function, let

$$t_n(s, \omega) = \frac{q_n(s; X_1, \dots, X_n)}{f_n(X_1, \dots, X_n)}, \quad n = 1, 2, \dots \quad (2.11)$$

By Lemma 1.3, there exists a set $A(s)$ such that $P(A(s)) = 1$, so we have

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \ln t_n(s, \omega) \leq 0, \quad \omega \in A(s). \quad (2.12)$$

By (1.3), (2.9), (2.11), and (2.12), we have

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \left[-s \sum_{k=1}^n h_k(X_k) - \sum_{k=1}^n \ln \tilde{f}_k(s) - \ln Z_n(\omega) \right] \leq 0, \quad \omega \in A(s). \quad (2.13)$$

Therefore,

$$r(\omega) \geq 0, \quad \omega \in A(0). \quad (2.14)$$

By (2.13) and (1.4), the property of the superior limit

$$\limsup_{n \rightarrow \infty} (a_n - b_n) \leq 0 \implies \limsup_{n \rightarrow \infty} a_n \leq \limsup_{n \rightarrow \infty} b_n, \quad (2.15)$$

and the inequality $\ln x \leq x - 1$ ($x > 0$), we have

$$\begin{aligned} & \limsup_{n \rightarrow \infty} \frac{1}{n} (-s) \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \\ & \leq \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [\ln \tilde{f}_k(s) + s E_Q h_k(X_k)] + r(\omega) \\ & \leq \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [\tilde{f}_k(s) - 1 + s E_Q h_k(X_k)] + r(\omega) \\ & = \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [\tilde{f}_k(s) - 1 - (-s) E_Q h_k(X_k)] + r(\omega), \quad \omega \in A(s). \end{aligned} \quad (2.16)$$

By the inequality $0 \leq e^x - 1 - x \leq (1/2)x^2e^{|x|}$, which can be found in [9], we have

$$0 \leq e^{-sh_k(X_k)} - 1 - (-s)h_k(X_k) \leq (1/2)(sh_k(X_k))^2 e^{|sh_k(X_k)|}. \quad (2.17)$$

By (2.5) and (2.17), we have

$$\begin{aligned} & \limsup_{n \rightarrow \infty} \frac{1}{n} (-s) \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \\ & \leq (1/2)s^2 \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n E_Q [(h_k(X_k))^2 e^{|sh_k(X_k)|}] + r(\omega), \quad \omega \in A(s). \end{aligned} \quad (2.18)$$

It is easy to see that $\varphi(x) = t^x x^2$ ($t > 1$) attains its largest value $\varphi(-2/\ln t) = 4e^{-2}/(\ln t)^2$ on the interval $(-\infty, 0]$, and $\varphi(x) = t^x x^2$ ($0 < t < 1$) attains its largest value $\varphi(-2/\ln t) = 4e^{-2}/(\ln t)^2$ on the interval $[0, \infty)$, we have

$$\sup \{e^{(s-s_0)h_k(X_k)} [h_k(X_k)]^2, k \geq 1\} \leq \frac{4e^{-2}}{(s-s_0)^2} = \frac{4e^{-2}}{(s_0-s)^2}, \quad 0 < s < s_0, \quad (2.19)$$

$$\sup \{e^{(s_0+s)(-h_k(X_k))} [-h_k(X_k)]^2, k \geq 1\} \leq \frac{4e^{-2}}{(s_0+s)^2}, \quad -s_0 < s < 0. \quad (2.20)$$

Let $0 < s < s_0$ in (2.18), by (2.19) and (2.1), we obtain

$$\begin{aligned} & (-s) \liminf_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \\ & \leq (1/2)s^2 \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n E_Q [(h_k(X_k))^2 e^{|sh_k(X_k)|}] + r(\omega) \\ & = (1/2)s^2 \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n E_Q [e^{s_0 h_k(X_k)} e^{(s-s_0)h_k(X_k)} (h_k(X_k))^2] + r(\omega) \\ & \leq \frac{2e^{-2}s^2 M(s_0)}{(s_0-s)^2} + r(\omega), \quad \omega \in A(s). \end{aligned} \quad (2.21)$$

Dividing the two sides of (2.21) by $-s$, we obtain

$$\begin{aligned} \liminf_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] & \geq -\frac{2e^{-2}sM(s_0)}{(s_0-s)^2} - \frac{r(\omega)}{s} \\ & \hat{=} \phi(s, r(\omega)), \quad 0 < s < s_0, \quad \omega \in A(s) \cap A(0). \end{aligned} \quad (2.22)$$

By (2.14) and $0 < s < s_0$, obviously $\phi(s, r(\omega)) \leq 0$, hence $\alpha(r(\omega)) \leq 0$. Let Q^+ be the set of rational numbers in the interval $(0, s_0)$, and let $A^* = \bigcap_{s \in Q^+} A(s)$, then $P(A^*) = 1$. By (2.22), then we have

$$\liminf_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \geq \phi(s, r(\omega)), \quad \omega \in A^* \cap A(0), \quad \forall s \in Q^+. \quad (2.23)$$

It is easy to see that $\phi(s, x)$ is a continuous function with respect to s on the interval $(0, s_0)$. For each $\omega \in A^* \cap A(0)$ ($0 \leq r(\omega) < \infty$), take $s_n(\omega) \in Q^+$, $n = 1, 2, \dots$, such that

$$\lim_{n \rightarrow \infty} \phi(s_n(\omega), r(\omega)) = \alpha(r(\omega)). \quad (2.24)$$

By (2.23), (2.24), and (2.8), we have

$$\liminf_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \geq -\beta(r(\omega)), \quad \omega \in A^* \cap A(0). \quad (2.25)$$

Since $P(A^* \cap A(0)) = 1$, (2.2) follows from (2.25).

Let $-s_0 < s < 0$ in (2.18), by (2.20) and (2.1), we have

$$\begin{aligned} & \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \\ & \leq -(1/2)s \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n E_Q [(h_k(X_k))^2 e^{|s|h_k(X_k)}] - \frac{r(\omega)}{s} \\ & = -(1/2)s \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n E_Q [e^{s_0 h_k(X_k)} e^{(s_0+s)(-h_k(X_k))} (-h_k(X_k))^2] - \frac{r(\omega)}{s} \\ & \leq -\frac{2e^{-2}sM(s_0)}{(s_0+s)^2} - \frac{r(\omega)}{s} \\ & \triangleq \phi(s, r(\omega)), \quad -s_0 < s < 0, \quad \omega \in A(s) \cap A(0). \end{aligned} \quad (2.26)$$

By (2.14) and $-s_0 < s < 0$, obviously $\phi(s, r(\omega)) \geq 0$, hence $\beta(r(\omega)) \geq 0$. Let Q^- be the set of rational numbers in the interval $(-s_0, 0)$, and let $A_* = \bigcap_{s \in Q^-} A(s)$, then $P(A_*) = 1$. Then we have by (2.26)

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \leq \phi(s, r(\omega)), \quad \omega \in A_* \cap A(0), \quad \forall s \in Q^-. \quad (2.27)$$

It is clear that $\phi(s, x)$ is a continuous function with respect to s on the interval $(-s_0, 0)$. For each $\omega \in A_* \cap A(0)$ ($0 \leq r(\omega) < \infty$), take $\lambda_n(\omega) \in Q^-$, $n = 1, 2, \dots$, such that

$$\lim_{n \rightarrow \infty} \phi(\lambda_n(\omega), r(\omega)) = \beta(r(\omega)). \quad (2.28)$$

By (2.27) and (2.28), we have

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - E_Q h_k(X_k)] \leq \beta(r(\omega)), \quad \omega \in A_* \cap A(0). \quad (2.29)$$

Since $P(A_* \cap A(0)) = 1$, (2.3) follows from (2.29).

By (2.4), (2.5), and (2.14), if $x > 0$, we have

$$0 \leq \beta(x) \leq \phi\left(-\frac{s_0\sqrt{x}}{1+\sqrt{x}}, x\right) = \frac{\sqrt{x}(1+\sqrt{x})}{s_0} [2e^{-2}M(s_0) + 1]. \quad (2.30)$$

If $x = 0$, we have

$$\beta(0) \leq \phi(-n^{-1}, 0) = \frac{2e^{-2}M(s_0)}{n(s_0 - n^{-1})^2}, \quad n \geq 1. \quad (2.31)$$

Noticing that $\beta(x) \geq 0$, ($x \geq 0$), (2.6) follows from (2.30) and (2.31). \square

Corollary 2.3. *If $P = Q$, or $\{X_n, n \geq 1\}$ is a sequence of independent random variables, and under the assumptions of (1) and (2), then*

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [h_k(X_k) - Eh_k(X_k)] = 0 \quad a.s. \quad (2.32)$$

Proof. In this case, $f_n(x_1, \dots, x_n) = \prod_{k=1}^n g_k(x_k)$, and $r(\omega) = 0$ a.s. Hence, (2.32) follows directly from (2.2) and (2.3). \square

3. An extension of the Shannon-McMillan theorem

In order to understand better, we first introduce some definitions in information theory in this section.

Let $\{X_n, n \geq 1\}$ be a sequence produced by an arbitrary continuous information source on the probability space (Ω, \mathcal{F}, P) with the joint density function

$$f_n(x_1, \dots, x_n) > 0, \quad x_k \in (-\infty, \infty), \quad 1 \leq k \leq n, \quad n = 1, 2, \dots \quad (3.1)$$

For the sake of brevity, we denote $f_n > 0$, and X_k stands for $X_k(\omega)$. Let

$$p_n(\omega) = -(1/n) \ln f_n(X_1, \dots, X_n), \quad (3.2)$$

where ω is the sample point, $p_n(\omega)$ is called the sample entropy or the entropy density of $\{X_k, 1 \leq k \leq n\}$. Also let Q be another probability measure on \mathcal{F} with the density function

$$q_n(x_1, \dots, x_n) > 0, \quad x_k \in (-\infty, \infty), \quad 1 \leq k \leq n, \quad n = 1, 2, \dots \quad (3.3)$$

Let

$$\begin{aligned} L_n(\omega) &= \ln [f_n(X_1, \dots, X_n) / q_n(X_1, \dots, X_n)], \\ L(\omega) &= \limsup_{n \rightarrow \infty} (1/n) L_n(\omega) \\ &= -\liminf_{n \rightarrow \infty} (1/n) \ln [q_n(X_1, \dots, X_n) / f_n(X_1, \dots, X_n)], \\ D(f_n \| q_n) &= E_P L_n \\ &= E_P \ln [f_n(X_1, \dots, X_n) / q_n(X_1, \dots, X_n)]. \end{aligned} \quad (3.4)$$

$L_n(\omega)$, $L(\omega)$, and $D(f_n \| q_n)$ are called the sample relative entropy, the sample relative entropy rate, and the relative entropy, respectively, relative to the reference density function $q_n(x_1, \dots, x_n)$. Indeed, they all are the measure of the deviation between the true joint distribution density function $f_n(x_1, \dots, x_n)$ and the reference distribution density function $q_n(x_1, \dots, x_n)$ (cf. [10, pages 12, 18]).

A question of importance in information theory is the study of the limit properties of the relative entropy density $f_n(\omega)$. Since Shannon's initial work was published (cf. [11]), there has been a great deal of investigation about this question (e.g., cf. [12–20]).

In this paper, a class of small deviation theorems (i.e., the strong limit theorems represented by inequalities) is established by using the analytical technique, and an extension of the Shannon-McMillan theorem to the arbitrary-dependent continuous information sources is given. Especially, an approach of applying the tool of Laplace transform to the study of the strong deviation theorems on the differential entropy is proposed.

Let $h_k(x_k) = -\ln g_k(x_k)$ ($1 \leq k \leq n$, $n = 1, 2, \dots$) in (1.5), then we give the following definitions.

Definition 3.1. The Laplace transform of $-\ln g_k(x_k)$ is defined by

$$\tilde{f}_k(s) = Ee^{-s(-\ln g_k(X_k))} = \int_{-\infty}^{\infty} e^{-s(-\ln g_k(x_k))} g_k(x_k) dx_k. \quad (3.5)$$

Definition 3.2. The differential entropy for continuous random variables X_k is defined by

$$h(X_k) = E[-\ln g_k(X_k)] = - \int_{-\infty}^{\infty} g_k(x_k) \ln g_k(x_k) dx_k. \quad (3.6)$$

In the following theorem, let $\{X_n, n \geq 1\}$ be independent random variables with respect to Q , then the reference density function $q_n(x_1, \dots, x_n) = \prod_{k=1}^n g_k(x_k)$, and let $h_k(X_k) = -\ln g_k(X_k)$ ($1 \leq k \leq n$) in Theorem 2.1.

Theorem 3.3. Let $\{X_n, n \geq 1\}$, $L_n(\omega)$, $L(\omega)$, $\tilde{f}_n(s)$ be given as above, and under the assumptions of (1) and (2), let

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n E_Q e^{s_0(-\ln g_k(X_k))} = \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n \tilde{f}_k(-s_0) = M(s_0) < \infty. \quad (3.7)$$

Then

$$\begin{aligned} \liminf_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [-\ln g_k(X_k) - h(X_k)] &\geq -\beta(L(\omega)), \quad a.s. \\ \limsup_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n [-\ln g_k(X_k) - h(X_k)] &\leq \beta(L(\omega)), \quad a.s. \end{aligned} \quad (3.8)$$

where

$$\beta(x) = \inf \{ \phi(s, x), -s_0 < s < 0 \}, \quad x \geq 0, \quad (3.9)$$

$$\phi(s, x) = -\frac{2e^{-2s}M(s_0)}{(s_0 - |s|)^2} - \frac{x}{s}, \quad x \geq 0, \quad (3.10)$$

$$0 \leq \beta(x) \leq \frac{\sqrt{x}(1 + \sqrt{x})}{s_0} [2e^{-2}M(s_0) + 1], \quad \lim_{x \rightarrow 0^+} \beta(x) = \beta(0) = 0. \quad (3.11)$$

Remark 3.4. Let

$$\alpha(x) = \sup \{ \phi(s, x), 0 < s < s_0 \}, \quad x \geq 0, \quad (3.12)$$

then

$$\alpha(x) = -\beta(x). \quad (3.13)$$

Corollary 3.5. Let $p_n(\omega)$ be defined by (3.2). Under the condition of Theorem 3.3, then

$$\begin{aligned} \liminf_{n \rightarrow \infty} [p_n(\omega) - (1/n)h(X_1, \dots, X_n)] &\geq \alpha(L(\omega)) - L(\omega) + H_* \quad a.s. \\ \limsup_{n \rightarrow \infty} [p_n(\omega) - (1/n)h(X_1, \dots, X_n)] &\leq \beta(L(\omega)) + H^* \quad a.s. \end{aligned} \quad (3.14)$$

where $h(X_1, \dots, X_n) = E[-\ln f_n(X_1, \dots, X_n)]$ is the differential entropy for (X_1, \dots, X_n) , and

$$\begin{aligned} H_* &= \liminf_{n \rightarrow \infty} (1/n) \left[\sum_{k=1}^n h(X_k) - h(X_1, \dots, X_n) \right] \\ &= \liminf_{n \rightarrow \infty} (1/n) D(f_n \| q_n), \\ H^* &= \limsup_{n \rightarrow \infty} (1/n) \left[\sum_{k=1}^n h(X_k) - h(X_1, \dots, X_n) \right] \\ &= \limsup_{n \rightarrow \infty} (1/n) D(f_n \| q_n), \end{aligned} \quad (3.15)$$

where $\alpha(L(\omega))$, $\beta(L(\omega))$ are denoted by (3.9)–(3.13).

Corollary 3.6. If $P = Q$, or $\{X_n, n \geq 1\}$ are independent random variables, and there exists $s_0 > 0$, such that (2.1) holds, then

$$\lim_{n \rightarrow \infty} [p_n(\omega) - (1/n)h(X_1, \dots, X_n)] = 0 \quad a.s. \quad (3.16)$$

Acknowledgments

This research is supported by the National Natural Science Foundation of China (Grants nos. 10671052 and 10571008), the Natural Science Foundation of Beijing (Grant no. 1072004), Funding Project for Academic Human Resources Development in Institutions of Higher Learning Under the Jurisdiction of Beijing Municipality, the Basic Research and Frontier Technology Foundation of Henan (Grant no. 072300410090), and the Natural Science Research Project of Henan (Grant no. 2008B110009). The authors would like to thank the editor and the referees for helpful comments, which helped to improve an earlier version of the paper.

Special Issue on Time-Dependent Billiards

Call for Papers

This subject has been extensively studied in the past years for one-, two-, and three-dimensional space. Additionally, such dynamical systems can exhibit a very important and still unexplained phenomenon, called as the Fermi acceleration phenomenon. Basically, the phenomenon of Fermi acceleration (FA) is a process in which a classical particle can acquire unbounded energy from collisions with a heavy moving wall. This phenomenon was originally proposed by Enrico Fermi in 1949 as a possible explanation of the origin of the large energies of the cosmic particles. His original model was then modified and considered under different approaches and using many versions. Moreover, applications of FA have been of a large broad interest in many different fields of science including plasma physics, astrophysics, atomic physics, optics, and time-dependent billiard problems and they are useful for controlling chaos in Engineering and dynamical systems exhibiting chaos (both conservative and dissipative chaos).

We intend to publish in this special issue papers reporting research on time-dependent billiards. The topic includes both conservative and dissipative dynamics. Papers discussing dynamical properties, statistical and mathematical results, stability investigation of the phase space structure, the phenomenon of Fermi acceleration, conditions for having suppression of Fermi acceleration, and computational and numerical methods for exploring these structures and applications are welcome.

To be acceptable for publication in the special issue of Mathematical Problems in Engineering, papers must make significant, original, and correct contributions to one or more of the topics above mentioned. Mathematical papers regarding the topics above are also welcome.

Authors should follow the Mathematical Problems in Engineering manuscript format described at <http://www.hindawi.com/journals/mpe/>. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at <http://mts.hindawi.com/> according to the following timetable:

Manuscript Due	March 1, 2009
First Round of Reviews	June 1, 2009
Publication Date	September 1, 2009
