# SOME SUBCLASSES OF CLOSE-TO-CONVEX AND QUASI-CONVEX FUNCTIONS 

Zhi-Gang Wang

#### Abstract

In the present paper, the author introduce two new subclasses $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ of close-to-convex functions and $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$ of quasi-convex functions with respect to $2 k$-symmetric conjugate points. The coefficient inequalities and integral representations for functions belonging to these classes are provided, the inclusion relationships and convolution conditions for these classes are also provided.

## 1. Introduction

Let $\mathcal{A}$ denote the class of functions of the form

$$
\begin{equation*}
f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n} \tag{1.1}
\end{equation*}
$$

which are analytic in the open unit disk $\mathcal{U}=\{z \in \mathbf{C}:|z|<1\}$. Let $\mathcal{S}, \mathcal{S}^{*}$, $\mathcal{K}, \mathcal{C}$ and $\mathcal{C}^{*}$ denote the familiar subclasses of $\mathcal{A}$ consisting of functions which are univalent, starlike, convex, close-to-convex and quasi-convex in $\mathcal{U}$, respectively (see, for details, $[2,4,6,7,8]$.

Al-Amiri, Coman and Mocanu [1] once introduced and investigated a class $\mathcal{S}_{s c}^{(k)}$ of functions starlike with respect to $2 k$-symmetric conjugate points, which satisfy the following inequality

$$
\Re\left\{\frac{z f^{\prime}(z)}{f_{2 k}(z)}\right\}>0 \quad(z \in \mathcal{U})
$$

where $k \geq 2$ is a fixed positive integer and $f_{2 k}(z)$ is defined by the following equality

$$
\begin{equation*}
f_{2 k}(z)=\frac{1}{2 k} \sum_{\nu=0}^{k-1}\left[\varepsilon^{-\nu} f\left(\varepsilon^{\nu} z\right)+\varepsilon^{\nu} \overline{f\left(\varepsilon^{\nu} \bar{z}\right)}\right] \quad(\varepsilon=\exp (2 \pi i / k) ; z \in \mathcal{U}) \tag{1.2}
\end{equation*}
$$

In the present paper, we introduce and investigate the following two more generalized subclasses $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ and $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$ of $\mathcal{A}$ with respect to $2 k$-symmetric conjugate points, and obtain some interesting results.

[^0]Definition 1. Let $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ denote the class of functions $f(z)$ in $\mathcal{A}$ satisfying the following inequality

$$
\begin{equation*}
\left|\frac{\frac{z f^{\prime}(z)}{f_{2 k}(z)}-1}{\beta \frac{z f^{\prime}(z)}{f_{2 k}(z)}+(1-\gamma)}\right|<1-\alpha \tag{1.3}
\end{equation*}
$$

where $0 \leq \alpha<1,0 \leq \beta \leq 1,0 \leq \gamma<1$ and $f_{2 k}(z)$ is defined by equality (1.2). And a function $f(z) \in \mathcal{A}$ is in the class $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$ if and only if $z f^{\prime}(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$.

Note that $\mathcal{S}_{s c}^{(k)}(0,1,0)=\mathcal{S}_{s c}^{(k)}$, so the class $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ is a generalization of the class $\mathcal{S}_{s c}^{(k)}$.

In our proposed investigation of the classes $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ and $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$, we shall also make use of the following lemmas.

Lemma 1. [3] Let $H(z)=1+\sum_{n=1}^{\infty} h_{n} z^{n}$ be analytic in $\mathcal{U}, 0 \leq \alpha<1,0 \leq$ $\beta \leq 1$ and $0 \leq \gamma<1$, then the inequality

$$
\left|\frac{H(z)-1}{\beta H(z)+(1-\gamma)}\right|<1-\alpha \quad(z \in \mathcal{U})
$$

can be written as

$$
H(z) \prec \frac{1+(1-\alpha)(1-\gamma) z}{1-(1-\alpha) \beta z} \quad(z \in \mathcal{U}),
$$

where" $\prec$ " stands for the usual subordination.
Lemma 2. Let $0 \leq \alpha<1,0 \leq \beta \leq 1$ and $0 \leq \gamma<1$, then we have

$$
\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma) \subset \mathcal{C} \subset \mathcal{S}
$$

Proof. Suppose that $f(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$, by Lemma 1, we know that the condition (1.3) can be written as

$$
\begin{equation*}
\frac{z f^{\prime}(z)}{f_{2 k}(z)} \prec \frac{1+(1-\alpha)(1-\gamma) z}{1-(1-\alpha) \beta z} \quad(z \in \mathcal{U}) \tag{1.4}
\end{equation*}
$$

Thus we have

$$
\begin{equation*}
\Re\left\{\frac{z f^{\prime}(z)}{f_{2 k}(z)}\right\}>0 \quad(z \in \mathcal{U}) \tag{1.5}
\end{equation*}
$$

since

$$
\Re\left\{\frac{1+(1-\alpha)(1-\gamma) z}{1-(1-\alpha) \beta z}\right\}>0 \quad(z \in \mathcal{U})
$$

Now it suffices to show that $f_{2 k}(z) \in \mathcal{S}^{*} \subset \mathcal{S}$. Substituting $z$ by $\varepsilon^{\mu} z(\mu=$ $0,1,2, \ldots, k-1)$ in (1.5), then (1.5) is also true, that is,

$$
\begin{equation*}
\Re\left\{\frac{\varepsilon^{\mu} z f^{\prime}\left(\varepsilon^{\mu} z\right)}{f_{2 k}\left(\varepsilon^{\mu} z\right)}\right\}>0 \quad(z \in \mathcal{U}) \tag{1.6}
\end{equation*}
$$

From inequality (1.6), we have

$$
\begin{equation*}
\Re\left\{\frac{\overline{\varepsilon^{\mu} \bar{z}} \overline{f^{\prime}\left(\varepsilon^{\mu} \bar{z}\right)}}{\overline{f_{2 k}\left(\varepsilon^{\mu} \bar{z}\right)}}\right\}>0 \quad(z \in \mathcal{U}) \tag{1.7}
\end{equation*}
$$

Note that $f_{2 k}\left(\varepsilon^{\mu} z\right)=\varepsilon^{\mu} f_{2 k}(z)$ and $\overline{f_{2 k}\left(\varepsilon^{\mu} \bar{z}\right)}=\varepsilon^{-\mu} f_{2 k}(z)$, then inequalities (1.6) and (1.7) can be written as

$$
\begin{equation*}
\Re\left\{\frac{z f^{\prime}\left(\varepsilon^{\mu} z\right)}{f_{2 k}(z)}\right\}>0 \quad(z \in \mathcal{U}) \tag{1.8}
\end{equation*}
$$

and

$$
\begin{equation*}
\Re\left\{\frac{z \overline{f^{\prime}\left(\varepsilon^{\mu} \bar{z}\right)}}{f_{2 k}(z)}\right\}>0 \quad(z \in \mathcal{U}) . \tag{1.9}
\end{equation*}
$$

Summing inequalities (1.8) and (1.9), we can get

$$
\begin{equation*}
\Re\left\{\frac{z\left(f^{\prime}\left(\varepsilon^{\mu} z\right)+\overline{f^{\prime}\left(\varepsilon^{\mu} \bar{z}\right)}\right)}{f_{2 k}(z)}\right\}>0 \quad(z \in \mathcal{U}) \tag{1.10}
\end{equation*}
$$

Letting $\mu=0,1,2, \ldots, k-1$ in (1.10), respectively, and summing them we can get

$$
\Re\left\{\frac{z\left[\frac{1}{2 k} \sum_{\mu=0}^{k-1}\left(f^{\prime}\left(\varepsilon^{\mu} z\right)+\overline{f^{\prime}\left(\varepsilon^{\mu} \bar{z}\right)}\right)\right]}{f_{2 k}(z)}\right\}>0 \quad(z \in \mathcal{U})
$$

or equivalently,

$$
\Re\left\{\frac{z f_{2 k}^{\prime}(z)}{f_{2 k}(z)}\right\}>0 \quad(z \in \mathcal{U})
$$

that is $f_{2 k}(z) \in \mathcal{S}^{*} \subset \mathcal{S}$. This means that $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma) \subset \mathcal{C} \subset \mathcal{S}$, hence the proof of Lemma 2 is complete.

Similarly, for the class $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$, we have
Lemma 3. Let $0 \leq \alpha<1,0 \leq \beta \leq 1$ and $0 \leq \gamma<1$, then we have

$$
\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma) \subset \mathcal{C}^{*} \subset \mathcal{C}
$$

LEmmA 4. [5] Let $-1 \leq B_{2} \leq B_{1}<A_{1} \leq A_{2} \leq 1$, then we have

$$
\frac{1+A_{1} z}{1+B_{1} z} \prec \frac{1+A_{2} z}{1+B_{2} z}
$$

In the present paper, we shall provide the coefficient inequalities and integral representations for functions belonging to the classes $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ and $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$, we shall also provide the inclusion relationships and convolution conditions for these classes.

## 2. Inclusion relationships

We first give some inclusion relationships for the classes $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ and $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$.

Theorem 1. Let $0 \leq \beta_{2} \leq \beta_{1} \leq 1,0 \leq \alpha_{1} \leq \alpha_{2}<1$ and $0 \leq \gamma_{1} \leq \gamma_{2}<1$, then we have

$$
\mathcal{S}_{s c}^{(k)}\left(\alpha_{2}, \beta_{2}, \gamma_{2}\right) \subset \mathcal{S}_{s c}^{(k)}\left(\alpha_{1}, \beta_{1}, \gamma_{1}\right)
$$

Proof. Suppose that $f(z) \in \mathcal{S}_{s c}^{(k)}\left(\alpha_{2}, \beta_{2}, \gamma_{2}\right)$, by (1.4), we have

$$
\frac{z f^{\prime}(z)}{f_{2 k}(z)} \prec \frac{1+\left(1-\alpha_{2}\right)\left(1-\gamma_{2}\right) z}{1-\left(1-\alpha_{2}\right) \beta_{2} z}
$$

Since $0 \leq \alpha_{1} \leq \alpha_{2}<1,0 \leq \beta_{2} \leq \beta_{1} \leq 1$ and $0 \leq \gamma_{1} \leq \gamma_{2}<1$, then we have

$$
-1 \leq-\left(1-\alpha_{1}\right) \beta_{1} \leq-\left(1-\alpha_{2}\right) \beta_{2}<\left(1-\alpha_{2}\right)\left(1-\gamma_{2}\right) \leq\left(1-\alpha_{1}\right)\left(1-\gamma_{1}\right) \leq 1
$$

Thus, by Lemma 4, we have

$$
\frac{z f^{\prime}(z)}{f_{2 k}(z)} \prec \frac{1+\left(1-\alpha_{2}\right)\left(1-\gamma_{2}\right) z}{1-\left(1-\alpha_{2}\right) \beta_{2} z} \prec \frac{1+\left(1-\alpha_{1}\right)\left(1-\gamma_{1}\right) z}{1-\left(1-\alpha_{1}\right) \beta_{1} z}
$$

that is $f(z) \in \mathcal{S}_{s c}^{(k)}\left(\alpha_{1}, \beta_{1}, \gamma_{1}\right)$. This means that $\mathcal{S}_{s c}^{(k)}\left(\alpha_{2}, \beta_{2}, \gamma_{2}\right) \subset \mathcal{S}_{s c}^{(k)}\left(\alpha_{1}, \beta_{1}, \gamma_{1}\right)$.
Similarly, for the class $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$, we have
Corollary 1. Let $0 \leq \beta_{2} \leq \beta_{1} \leq 1,0 \leq \alpha_{1} \leq \alpha_{2}<1$ and $0 \leq \gamma_{1} \leq \gamma_{2}<1$, then we have

$$
\mathcal{C}_{s c}^{(k)}\left(\alpha_{2}, \beta_{2}, \gamma_{2}\right) \subset \mathcal{C}_{s c}^{(k)}\left(\alpha_{1}, \beta_{1}, \gamma_{1}\right)
$$

## 3. Coefficient inequalities

In this section, we give some coefficient inequalities for functions belonging to the classes $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ and $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$.

ThEOREM 2. Let $f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n}$ be analytic in $\mathcal{U}$, if for $0 \leq \alpha<$ $1,0 \leq \beta \leq 1$ and $0 \leq \gamma<1$, we have

$$
\begin{equation*}
\sum_{n=2}^{\infty} n[1+(1-\alpha) \beta]\left|a_{n}\right|+\sum_{l=1}^{\infty}[(1-\alpha)(1-\gamma)+1]\left|\Re\left(a_{l k+1}\right)\right| \leq(1-\alpha)(1+\beta-\gamma) \tag{3.1}
\end{equation*}
$$

then $f(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$.
Proof. Suppose that $f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n}$, and $f_{2 k}(z)$ is defined by equality (1.2). We now let $M$ be denoted by

$$
\begin{aligned}
M:= & \left|z f^{\prime}(z)-f_{2 k}(z)\right|-(1-\alpha)\left|\beta z f^{\prime}(z)+(1-\gamma) f_{2 k}(z)\right| \\
= & \left|\sum_{n=2}^{\infty} n a_{n} z^{n}-\sum_{n=2}^{\infty} \Re\left(a_{n}\right) c_{n} z^{n}\right| \\
& -(1-\alpha)\left|\beta\left(z+\sum_{n=2}^{\infty} n a_{n} z^{n}\right)+(1-\gamma)\left(z+\sum_{n=2}^{\infty} \Re\left(a_{n}\right) c_{n} z^{n}\right)\right|
\end{aligned}
$$

where

$$
c_{n}=\frac{1}{k} \sum_{\nu=0}^{k-1} \varepsilon^{(n-1) \nu}=\left\{\begin{array}{ll}
1, & n=l k+1,  \tag{3.2}\\
0, & n \neq l k+1
\end{array}(\varepsilon=\exp (2 \pi i / k) ; l \in \mathbf{N}=\{1,2, \ldots\})\right.
$$

Thus, for $|z|=r<1$, we have

$$
\begin{aligned}
M \leq & \sum_{n=2}^{\infty}\left(n\left|a_{n}\right|+\left|\Re\left(a_{n}\right)\right| c_{n}\right) r^{n} \\
& -(1-\alpha)\left[(1+\beta-\gamma) r-\sum_{n=2}^{\infty}\left[n \beta\left|a_{n}\right|+(1-\gamma)\left|\Re\left(a_{n}\right)\right| c_{n}\right] r^{n}\right] \\
< & \left(\sum_{n=2}^{\infty}\left\{n[1+(1-\alpha) \beta]\left|a_{n}\right|+[(1-\alpha)(1-\gamma)+1]\left|\Re\left(a_{n}\right)\right| c_{n}\right\}\right. \\
& -(1-\alpha)(1+\beta-\gamma)) r \\
< & \sum_{n=2}^{\infty}\left\{n[1+(1-\alpha) \beta]\left|a_{n}\right|+[(1-\alpha)(1-\gamma)+1]\left|\Re\left(a_{n}\right)\right| c_{n}\right\}-(1-\alpha)(1+\beta-\gamma) \\
= & \sum_{n=2}^{\infty} n[1+(1-\alpha) \beta]\left|a_{n}\right|+\sum_{l=1}^{\infty}[(1-\alpha)(1-\gamma)+1]\left|\Re\left(a_{l k+1}\right)\right|-(1-\alpha)(1+\beta-\gamma)
\end{aligned}
$$

From inequality (3.1), we know that $M<0$, thus we can get inequality (1.3), that is $f(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$. This completes the proof of Theorem 2.

Similarly, for the class $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$, we have
Corollary 2. Let $f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n}$ be analytic in $\mathcal{U}$, if for $0 \leq \alpha<$ $1,0 \leq \beta \leq 1$ and $0 \leq \gamma<1$, we have
$\sum_{n=2}^{\infty} n^{2}[1+(1-\alpha) \beta]\left|a_{n}\right|+\sum_{l=1}^{\infty}[(1-\alpha)(1-\gamma)+1](l k+1)\left|\Re\left(a_{l k+1}\right)\right| \leq(1-\alpha)(1+\beta-\gamma)$,
then $f(z) \in \mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$.

## 4. Integral representations

In this section, we provide the integral representations for functions belonging to the classes $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ and $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$.

Theorem 3. Let $f(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$, then we have

$$
\begin{align*}
f_{2 k}(z)=z \cdot \exp \{ & \frac{1}{2 k} \sum_{\mu=0}^{k-1} \int_{0}^{z} \frac{(1-\alpha)(1+\beta-\gamma)}{\zeta} \times \\
& \left.\times\left[\frac{\omega\left(\varepsilon^{\mu} \zeta\right)}{1-(1-\alpha) \beta \omega\left(\varepsilon^{\mu} \zeta\right)}+\frac{\overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}{1-(1-\alpha) \beta \overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}\right] d \zeta\right\} \tag{4.1}
\end{align*}
$$

where $f_{2 k}(z)$ is defined by equality (1.2), $\omega(z)$ is analytic in $\mathcal{U}$ and $\omega(0)=0$, $|\omega(z)|<1$.

Proof. Suppose that $f(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$, by (1.4), we have

$$
\begin{equation*}
\frac{z f^{\prime}(z)}{f_{2 k}(z)}=\frac{1+(1-\alpha)(1-\gamma) \omega(z)}{1-(1-\alpha) \beta \omega(z)} \tag{4.2}
\end{equation*}
$$

where $\omega(z)$ is analytic in $\mathcal{U}$ and $\omega(0)=0,|\omega(z)|<1$. Substituting $z$ by $\varepsilon^{\mu} z(\mu=$ $0,1,2, \ldots, k-1$ ) in (4.2), we have

$$
\begin{equation*}
\frac{\varepsilon^{\mu} z f^{\prime}\left(\varepsilon^{\mu} z\right)}{f_{2 k}\left(\varepsilon^{\mu} z\right)}=\frac{1+(1-\alpha)(1-\gamma) \omega\left(\varepsilon^{\mu} z\right)}{1-(1-\alpha) \beta \omega\left(\varepsilon^{\mu} z\right)} \tag{4.3}
\end{equation*}
$$

From equality (4.3), we have

$$
\begin{equation*}
\frac{\overline{\varepsilon^{\mu} \bar{z}} \overline{f^{\prime}\left(\varepsilon^{\mu} \bar{z}\right)}}{\overline{f_{2 k}\left(\varepsilon^{\mu} \bar{z}\right)}}=\frac{1+(1-\alpha)(1-\gamma) \overline{\omega\left(\varepsilon^{\mu} \bar{z}\right)}}{1-(1-\alpha) \beta \overline{\omega\left(\varepsilon^{\mu} \bar{z}\right)}} \tag{4.4}
\end{equation*}
$$

Summing equalities (4.3) and (4.4), and making use of the same method as in Lemma 2, we have

$$
\begin{equation*}
\frac{z f_{2 k}^{\prime}(z)}{f_{2 k}(z)}=\frac{1}{2 k} \sum_{\mu=0}^{k-1}\left[\frac{1+(1-\alpha)(1-\gamma) \omega\left(\varepsilon^{\mu} z\right)}{1-(1-\alpha) \beta \omega\left(\varepsilon^{\mu} z\right)}+\frac{1+(1-\alpha)(1-\gamma) \overline{\omega\left(\varepsilon^{\mu} \bar{z}\right)}}{1-(1-\alpha) \beta \overline{\omega\left(\varepsilon^{\mu} \bar{z}\right)}}\right] \tag{4.5}
\end{equation*}
$$

from equality (4.5), we can get

$$
\begin{align*}
& \frac{f_{2 k}^{\prime}(z)}{f_{2 k}(z)}-\frac{1}{z}=\frac{1}{2 k} \sum_{\mu=0}^{k-1} \frac{1}{z}\left\{\left[\frac{1+(1-\alpha)(1-\gamma) \omega\left(\varepsilon^{\mu} z\right)}{1-(1-\alpha) \beta \omega\left(\varepsilon^{\mu} z\right)}+\right.\right. \\
& \left.\left.\quad+\frac{1+(1-\alpha)(1-\gamma) \overline{\omega\left(\varepsilon^{\mu} \bar{z}\right)}}{1-(1-\alpha) \beta \overline{\omega\left(\varepsilon^{\mu} \bar{z}\right)}}\right]-2\right\} \tag{4.6}
\end{align*}
$$

Integrating equality (4.6), we have

$$
\begin{align*}
\log \left\{\frac{f_{2 k}(z)}{z}\right\}=\frac{1}{2 k} \sum_{\mu=0}^{k-1} & \int_{0}^{z} \frac{(1-\alpha)(1+\beta-\gamma)}{\zeta} \times \\
& \times\left[\frac{\omega\left(\varepsilon^{\mu} \zeta\right)}{1-(1-\alpha) \beta \omega\left(\varepsilon^{\mu} \zeta\right)}+\frac{\overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}{1-(1-\alpha) \beta \overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}\right] d \zeta \tag{4.7}
\end{align*}
$$

From equality (4.7), we can get equality (4.1) easily. This completes the proof of Theorem 3.

Theorem 4. Let $f(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$, then we have

$$
\begin{align*}
f(z)= & \int_{0}^{z} \exp \left\{\frac { 1 } { 2 k } \sum _ { \mu = 0 } ^ { k - 1 } \int _ { 0 } ^ { \xi } \frac { ( 1 - \alpha ) ( 1 + \beta - \gamma ) } { \zeta } \left[\frac{\omega\left(\varepsilon^{\mu} \zeta\right)}{1-(1-\alpha) \beta \omega\left(\varepsilon^{\mu} \zeta\right)}\right.\right. \\
& \left.\left.+\frac{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}{1-(1-\alpha) \beta \overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}\right] d \zeta\right\} \cdot \frac{1+(1-\alpha)(1-\gamma) \omega(\xi)}{1-(1-\alpha) \beta \omega(\xi)} d \xi \tag{4.8}
\end{align*}
$$

where $\omega(z)$ is analytic in $\mathcal{U}$ and $\omega(0)=0,|\omega(z)|<1$.

Proof. Suppose that $f(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$, from equalities (4.1) and (4.2), we can get

$$
\begin{aligned}
f^{\prime}(z)= & \frac{f_{2 k}(z)}{z} \cdot \frac{1+(1-\alpha)(1-\gamma) \omega(z)}{1-(1-\alpha) \beta \omega(z)} \\
= & \exp \left\{\frac { 1 } { 2 k } \sum _ { \mu = 0 } ^ { k - 1 } \int _ { 0 } ^ { z } \frac { ( 1 - \alpha ) ( 1 + \beta - \gamma ) } { \zeta } \left[\frac{\omega\left(\varepsilon^{\mu} \zeta\right)}{1-(1-\alpha) \beta \omega\left(\varepsilon^{\mu} \zeta\right)}\right.\right. \\
& \left.\left.+\frac{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}{1-(1-\alpha) \beta \overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}\right] d \zeta\right\} \cdot \frac{1+(1-\alpha)(1-\gamma) \omega(z)}{1-(1-\alpha) \beta \omega(z)}
\end{aligned}
$$

Integrating the above equality, we can get equality (4.8) easily. Hence the proof of Theorem 4 is complete.

Similarly, for the class $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$, we have
Corollary 3. Let $f(z) \in \mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$, then we have

$$
\begin{aligned}
& f_{2 k}(z)=\int_{0}^{z} \exp \left\{\frac{1}{2 k} \sum_{\mu=0}^{k-1} \int_{0}^{\xi} \frac{(1-\alpha)(1+\beta-\gamma)}{\zeta} \times\right. \\
&\left.\times\left[\frac{\omega\left(\varepsilon^{\mu} \zeta\right)}{1-(1-\alpha) \beta \omega\left(\varepsilon^{\mu} \zeta\right)}+\frac{\overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}{1-(1-\alpha) \beta \overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}\right] d \zeta\right\} d \xi,
\end{aligned}
$$

where $f_{2 k}(z)$ is defined by equality (1.2), $\omega(z)$ is analytic in $\mathcal{U}$ and $\omega(0)=0$, $|\omega(z)|<1$.

Corollary 4. Let $f(z) \in \mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$, then we have

$$
\begin{aligned}
f(z)= & \int_{0}^{z} \frac{1}{t} \int_{0}^{t} \exp \left\{\frac { 1 } { 2 k } \sum _ { \mu = 0 } ^ { k - 1 } \int _ { 0 } ^ { \xi } \frac { ( 1 - \alpha ) ( 1 + \beta - \gamma ) } { \zeta } \left[\frac{\omega\left(\varepsilon^{\mu} \zeta\right)}{1-(1-\alpha) \beta \omega\left(\varepsilon^{\mu} \zeta\right)}\right.\right. \\
& \left.\left.+\frac{\overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}{1-(1-\alpha) \beta \overline{\omega\left(\varepsilon^{\mu} \bar{\zeta}\right)}}\right] d \zeta\right\} \cdot \frac{1+(1-\alpha)(1-\gamma) \omega(\xi)}{1-(1-\alpha) \beta \omega(\xi)} d \xi d t
\end{aligned}
$$

where $\omega(z)$ is analytic in $\mathcal{U}$ and $\omega(0)=0,|\omega(z)|<1$.

## 5. Convolution conditions

Finally, we provide the convolution conditions for the classes $\mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ and $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$. Let $f, g \in \mathcal{A}$, where $f(z)$ is given by (1.1) and $g(z)$ is defined by

$$
g(z)=z+\sum_{n=2}^{\infty} b_{n} z^{n}
$$

then the Hadamard product (or convolution) $f * g$ is defined (as usual) by

$$
(f * g)(z)=z+\sum_{n=2}^{\infty} a_{n} b_{n} z^{n}=(g * f)(z)
$$

Theorem 5. A function $f(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$ if and only if

$$
\begin{gather*}
\frac{1}{z}\left\{f *\left\{\frac{z}{(1-z)^{2}}\left[1-(1-\alpha) \beta e^{i \theta}\right]-\frac{1+(1-\alpha)(1-\gamma) e^{i \theta}}{2} h\right\}(z)\right. \\
\left.-\frac{1+(1-\alpha)(1-\gamma) e^{i \theta}}{2} \cdot \overline{(f * h)(\bar{z})}\right\} \neq 0 \tag{5.1}
\end{gather*}
$$

for all $z \in \mathcal{U}$ and $0 \leq \theta<2 \pi$, where $h(z)$ is given by (5.6).
Proof. Suppose that $f(z) \in \mathcal{S}_{s c}^{(k)}(\alpha, \beta, \gamma)$, we know that the condition (1.3) can be written as (1.4), since (1.4) is equivalent to

$$
\begin{equation*}
\frac{z f^{\prime}(z)}{f_{2 k}(z)} \neq \frac{1+(1-\alpha)(1-\gamma) e^{i \theta}}{1-(1-\alpha) \beta e^{i \theta}} \tag{5.2}
\end{equation*}
$$

for all $z \in \mathcal{U}$ and $0 \leq \theta<2 \pi$. It is easy to know that the condition (5.2) can be written as

$$
\begin{equation*}
\frac{1}{z}\left\{\left[1-(1-\alpha) \beta e^{i \theta}\right] z f^{\prime}(z)-\left[1+(1-\alpha)(1-\gamma) e^{i \theta}\right] f_{2 k}(z)\right\} \neq 0 \tag{5.3}
\end{equation*}
$$

On the other hand, it is well known that

$$
\begin{equation*}
z f^{\prime}(z)=f(z) * \frac{z}{(1-z)^{2}} \tag{5.4}
\end{equation*}
$$

And from the definition of $f_{2 k}(z)$, we know that

$$
\begin{equation*}
f_{2 k}(z)=\frac{1}{2}[(f * h)(z)+\overline{(f * h)(\bar{z})}] \tag{5.5}
\end{equation*}
$$

where

$$
\begin{equation*}
h(z)=\frac{1}{k} \sum_{v=0}^{k-1} \frac{z}{1-\varepsilon^{v} z} . \tag{5.6}
\end{equation*}
$$

Substituting (5.4) and (5.5) into (5.3), we can get (5.1) easily. This completes the proof of Theorem 5.

Similarly, for the class $\mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$, we have
Corollary 5. A function $f(z) \in \mathcal{C}_{s c}^{(k)}(\alpha, \beta, \gamma)$ if and only if

$$
\begin{gathered}
\frac{1}{z}\left\{f *\left\{z\left\{\frac{z}{(1-z)^{2}}\left[1-(1-\alpha) \beta e^{i \theta}\right]-\frac{1+(1-\alpha)(1-\gamma) e^{i \theta}}{2} h\right\}^{\prime}\right\}(z)\right. \\
\left.-\frac{1+(1-\alpha)(1-\gamma) e^{i \theta}}{2} \cdot \overline{\left[f *\left(z h^{\prime}\right)\right](\bar{z})}\right\} \neq 0
\end{gathered}
$$

for all $z \in \mathcal{U}$ and $0 \leq \theta<2 \pi$, where $h(z)$ is given by (5.6).
