

ON EXTRAPOLATION OF MOVING AVERAGE AND AUTOREGRESSIVE PROCESSES

Pavle Mladenović

1. Introduction

Let $X(s) = (X_1(s), \dots, X_n(s))$, $s \in R$, be a multidimensional wide sense stationary random process with the mean value zero, spectral density matrix $\|f_{jk}^x(\lambda)\|$ and spectral process $Z^x(\lambda) = (Z_1^x(\lambda), \dots, Z_n^x(\lambda))$, $\lambda \in R$. Suppose we know the values of the process $X(s)$ on the finite interval $[t - T, t]$. The problem of linear extrapolation of stationary random process $X(s)$ at the point $t + \tau$, $\tau > 0$, can be formulated as follows: Find the random variable

$$\tilde{X}_1(t, \tau, T) = \sum_{k=1-n}^n \int_{-\infty}^{+\infty} e^{it\lambda} \Phi_k(\lambda) dZ_k^X(\lambda) \quad (1.1)$$

which is the linear least-squares estimator of $X_1(t + \tau)$ given $X_k(s)$, $t - T \leq s \leq t$, $k = 1, 2, \dots, n$. The function $(\Phi_1(\lambda), \dots, \Phi_n(\lambda))$ will be called the spectral characteristic for extrapolation of the process $X(s)$ at the point $t + \tau$. Let $H(X)$ denote the Hilbert space generated by $\{X_k(s), -\infty < s < +\infty, k = 1, 2, \dots, n\}$, and $H(X, t, T)$ -the smallest Hilbert space spanned by $\{X_k(s) \mid t - T \leq s \leq t, k = 1, 2, \dots, n\}$. Then, $\tilde{X}_1(t, \tau, T)$ is the projection of $X_1(t + \tau)$ into $H(X, t, T)$.

For the class of stationary random processes $X(s) = (X_1(s), \dots, X_n(s))$ having the nonsingular spectral density matrix $\|f_{jk}(\lambda)\|$, where all $f_{jk}(\lambda)$ are rational functions of λ , this extrapolation problem was studied in [6].

Now, let $X(s) = (X_1(s), \dots, X_n(s))$ and $Y(s) = (Y_1(s), \dots, Y_n(s))$ be two multidimensional stationary random processes satisfying the following equation

$$Y(s) = \sum_{\nu=0}^N a_\nu X(s - \nu\theta), \quad a_0 = 1, \quad a_\nu \in R, \quad \theta > 0 \quad (1.2)$$

and let the roots of the equation

$$\lambda^N + a_1 \lambda^{N-1} + \cdots + a_{N-1} \lambda + a_N = 0 \quad (1.3)$$

be smaller than one in absolute value. Then,

$$X_k(s) = \sum_{\nu=0}^{\infty} c_\nu Y_k(s - \nu\theta), \quad k = 1, 2, \dots, n, \quad (1.4)$$

when the series on the right side of (1.4) converges in quadratic mean and the coefficients c_ν satisfy the homogeneous difference equations

$$a_0 c_k + a_1 c_{k-1} + \cdots + a_N c_{k-N} = 0, \quad k \geq N \quad (1.5)$$

and the initial conditions

$$c_0 = 1, \quad a_0 c_k + a_1 c_{k-1} + \cdots + a_k c_0 = 0, \quad 0 < k < N. \quad (1.6)$$

If $\|f_{jk}^X(\lambda)\|$ and $\|f_{jk}^Y(\lambda)\|$ are the spectral matrices of the processes $X(s)$ and $Y(s)$, then we have

$$f_{jk}^Y(\lambda) = \left| \sum_{\nu=0}^N a_\nu e^{-i\nu\theta\lambda} \right|^2 f_{jk}^X(\lambda). \quad (1.7)$$

In this paper we shall find:

I) the linear least-squares estimator $\tilde{Y}_1(t, \tau, T)$ of $Y_1(t + \tau)$ given the values $Y_k(s)$, $t - T \leq s \leq t$, $k = 1, 2, \dots, n$, if $X(s)$ is a nonsingular process with a rational spectrum,

II) the linear least-squares estimator $\tilde{X}_1(t, \tau, T)$ of $X_1(t + \tau)$ given the values $X_k(s)$, $t - T \leq s \leq t$, $k = 1, 2, \dots, n$, if $Y(s)$ is a nonsingular stationary random process with a rational spectrum.

For the single processes $Y(s) = Y_1(s)$ and $X(s) = X_1(s)$ this problem was studied in [3].

The following lemma will be used:

LEMMA 1. (Yaglom, A. M., [6 275–277]): *A function $(\Phi_1(\lambda), \dots, \Phi_n(\lambda))$ is the spectral characteristic for extrapolation of a stationary random process $X(s)$ at the point $t + \tau$, $\tau > 0$, given $X_k(s)$, $t - T \leq s \leq t$, $k = 1, \dots, n$, if and only if:*

$$1^\circ. \int_{-\infty}^{+\infty} |\Phi_k(\lambda)|^2 f_{kk}^X(\lambda) d\lambda < \infty, \quad k = 1, 2, \dots, n \quad (1.8)$$

2°. *The functions*

$$\psi_k(\lambda) = (e^{i\tau\lambda} - \Phi_1(\lambda)) f_{1k}(\lambda) - \sum_{j=2}^n \Phi_j(\lambda) f_{jk}(\lambda), \quad k = 1, 2, \dots, n \quad (1.9)$$

can be represented in the form

$$\psi_k(\lambda) = \psi_k^{(1)}(\lambda) + e^{-i\lambda\tau} \psi_k^{(2)}(\lambda) \quad (1.10)$$

where: a_1) the function $\psi_{(k)}^1(\lambda)$ is analytic in the upper half-plane and

a_2) as $|\lambda| \rightarrow \infty$ in the upper half-plane, $\psi_{(k)}^1(\lambda)$ falls off faster than $|\lambda|^{-1-\varepsilon}$, $\varepsilon > 0$,

b_1) the function $\psi_k^{(2)}(\lambda)$ is analytic in the lower half-plane and

b_2) as $|\lambda| \rightarrow \infty$ in the lower half-plane, $\psi_k^{(2)}(\lambda)$ falls off faster than $|\lambda|^{-1-\varepsilon}$, $\varepsilon > 0$.

3° the functions $\Phi_k(\lambda)$, $k = 1, 2, \dots, n$, are analytic functions represented in the form

$$\Phi_k(\lambda) = \sum_{\nu} e^{i\tau_{\nu}\lambda} R_{k,\nu}(\lambda) \tag{1.11}$$

where $R_{k,\nu}(\lambda)$ are rational functions and $\tau_{\nu} \in [-T, 0]$.

For a stationary random process with the nonsingular spectral density matrix $\|f_{jk}(\lambda)\|$, where all $f_{jk}(\lambda)$ are rational functions of λ , we shall use the following notation

$$D(\lambda) = \det \|f_{jk}(\lambda)\| = \det \left\| \frac{Q_{jk}(\lambda)}{P_{jk}(\lambda)} \right\| = \frac{Q(\lambda)}{P(\lambda)},$$

$$P(\lambda) = (\lambda - \theta_1) \cdots (\lambda - \theta_L)(\lambda - \bar{\theta}_1) \cdots (\lambda - \bar{\theta}_L)$$

and we shall denote the degrees of polynomials $P_{jj}(\lambda)$, $Q_{jj}(\lambda)$, $P(\lambda)$, $Q(\lambda)$, by $2N_{jj}$, $2(N_{jj} - m_j)$, $2K$, $2L$, respectively.

2. Extrapolation of moving average processes

THEOREM 2.1. *Let $X(s) = (X_1(s), \dots, X_n(s))$ be a nonsingular stationary random process with a rational spectrum, and let $Y(s)$ be given by (1.2) where the roots of the equations (1.3) are less than one in absolute value. Suppose we know the values $Y_k(s)$, $t - T \leq s \leq t$, $k = 1, 2, \dots, n$, and suppose T/θ is not an integer. Denote $[T/\theta] = l$ and $[\tau/\theta] = S$.*

If $S \geq N$, then the spectral characteristic $(\Phi_1^Y(\lambda), \dots, \Phi_n^Y(\lambda))$ for extrapolation of a stationary random process $Y(s)$ at the point $t + \tau$ has the following form:

$$\Phi_k^Y(\lambda) = R_k^{(1)}(\lambda) \sum_{j=0}^l c_{kj}^1 e^{-i\lambda j\theta} + e^{-i\lambda T} R_k^{(2)}(\lambda) \sum_{j=0}^l c_{kj}^{(2)} e^{i\lambda j\theta}, \quad k = 1, 2, \dots, n \tag{2.1}$$

where

$$R_k^{(i)}(\lambda) = \frac{\omega_k^{(i)}(\lambda)}{(\lambda - \theta_1) \cdots (\lambda - \theta_L)(\lambda - \bar{\theta}_1) - \cdots (\lambda - \bar{\theta}_L)} \tag{2.2}$$

and $\omega_k^{(i)}(\lambda)$, $i = 1, 2$ are the polynomials of the degree $2L + m_k - 1$.

Proof. The functions $\Phi_k(\lambda)$, $k = 1, 2, \dots, n$, given by (2.1) and (2.2) have the form (1.11) and satisfy the condition 1° of Lemma 1. We shall define the

coefficients $c_{kj}^{(1)}, c_{kj}^{(2)}$ and the coefficients of the polynomials $\omega_k^{(i)}(\lambda)$ so that these functions satisfy the conditions 2° and 3°.

Using (1.7), we have

$$\begin{aligned} \psi_m^Y(\lambda) &= (e^{i\tau\lambda} - \Phi_1^Y(\lambda))f_{1m}^Y(\lambda) + \sum_{k=2}^n \Phi_k^Y(\lambda)f_{km}^Y(\lambda) = \\ &= \left\{ (e^{i\theta\lambda} - \Phi_1^Y(\lambda))f_{1m}^X(\lambda) + \sum_{k=2}^n \Phi_k^Y(\lambda)f_{km}^X(\lambda) \right\} \left| \sum_{j=0}^N a_j e^{-i\lambda j\theta} \right|^2. \end{aligned} \quad (2.3)$$

Using the following equations

$$\left| \sum_{j=0}^N a_j e^{-i\lambda j\theta} \right|^2 = \sum_{j=-N}^N b_j e^{i\lambda j\theta}, \quad \lambda \in R \quad (2.4)$$

$$\sum_{j=0}^l c_{kj}^{(1)} e^{-i\lambda j\theta} \sum_{j=-N}^N b_j e^{i\lambda j\theta} = \sum_{j=-N-l}^N \alpha_{kj} e^{i\lambda j\theta} \quad (2.5)$$

$$\sum_{j=0}^l c_{kj}^{(2)} e^{i\lambda j\theta} \sum_{j=-N}^N b_j e^{i\lambda j\theta} = \sum_{j=-N}^{N+l} \beta_{kj} e^{i\lambda j\theta} \quad (2.6)$$

the functions $\psi_m^Y(\lambda)$, $m = 1, 2, \dots, n$ can be represented in the form

$$\begin{aligned} \psi_m^Y(\lambda) &= \sum_{j=-N}^N b_j e^{i\lambda(\tau+j\theta)} f_{1m}^X(\lambda) - \sum_{k=1}^n \psi_{k,1}(\lambda) f_{k,m}^X(\lambda) - \\ &- e^{-i\lambda T} \sum_{k=1}^n \psi_{k,2}(\lambda) f_{km}^X(\lambda) - \sum_{k=1}^n \chi_k(\lambda) f_{km}^X(\lambda) \end{aligned} \quad (2.7)$$

where

$$\psi_{k,1}(\lambda) = R_k^{(1)}(\lambda) \sum_{j=0}^N \alpha_{kj} e^{i\lambda j\theta} + R_k^{(2)}(\lambda) \sum_{j=l+1}^{l+N} \beta_{kj} e^{i\lambda(-T+j\theta)} \quad (2.8)$$

$$\psi_{k,2}(\lambda) = R_k^{(1)}(\lambda) \sum_{j=-N-l}^{-l-1} \alpha_{kj} e^{i\lambda(T+j\theta)} + R_k^{(2)}(\lambda) \sum_{j=-N}^0 \beta_{kj} e^{i\lambda j\theta} \quad (2.9)$$

$$\chi_k(\lambda) = R_k^{(1)}(\lambda) \sum_{j=-l}^{-1} \alpha_{kj} e^{i\lambda j\theta} + e^{-i\lambda T} R_k^{(2)}(\lambda) \sum_{j=l}^l \beta_{kj} e^{i\lambda j\theta} \quad (2.10)$$

The condition $S \geq N$ implies the following inequalities

$$\tau + j\theta \geq 0, \quad j = -N, -N+1, \dots, N.$$

If we define

$$\psi_m^{(1)}(\lambda) = \sum_{j=-N}^N b_j e^{i\lambda(\tau+j\theta)} f_{1m}^X(\lambda) - \sum_{k=1}^n \psi_{k,1}(\lambda) f_{km}^X(\lambda) \quad (2.11)$$

$$\psi_m^{(2)}(\lambda) = - \sum_{k=1}^n \psi_{k,2}(\lambda) f_{km}^X(\lambda) \quad (2.12)$$

and if we put

$$\chi_k(\lambda) = 0, \quad k = 1, 2, \dots, n \quad (2.13)$$

then, the functions $\psi_m^Y(\lambda)$ will have the form (1.10), and the conditions $a_2)$ and $b_2)$ of Lemma 1. will be satisfied.

The equations (2.13) imply the following equations

$$\alpha_{k,j} = 0, \quad j = -l, -l+1, \dots, -1, \quad k = 1, 2, \dots, n \quad (2.14)$$

$$\beta_{k,j} = 0, \quad j = 1, 2, \dots, l, \quad k = 1, 2, \dots, n \quad (2.15)$$

If we put $c_{k0}^{(1)} = c_{k0}^{(2)} = 1$, $k = 1, 2, \dots, n$, then, from (2.14) and (2.15) we can determine

$$c_{1j}^{(1)} = c_{2j}^{(1)} = \dots = c_{nj}^{(1)} (= c_j^{(1)}), \quad j = 1, 2, \dots, l, \quad (2.16)$$

$$c_{1j}^{(2)} = c_{2j}^{(2)} = \dots = c_{nj}^{(2)} (= c_j^{(2)}), \quad j = 1, 2, \dots, l, \quad (2.17)$$

The coefficients of the polynomials $\omega_k^{(i)}(\lambda)$, $i = 1, 2$, $k = 1, \dots, n$ (there are $4nL + 2(m_1 + m_2 + \dots + m_n)$ of such coefficients) can be found as in [6] so that the conditions $a_1)$, $a_2)$ and 3° are satisfied.

Remark 1: If we consider the following equations

$$Y_j(s) = \sum_{\nu=0}^N a_\nu^{(j)} X(s - \nu\theta), \quad a_0^{(j)} = 1, \quad j = 1, 2, \dots, n$$

instead of (1.2) and if the roots of the equations

$$\lambda^N + a_1^{(j)} \lambda^{N-1} + \dots + a_{N-1}^{(j)} \lambda + a_N^{(j)} = 0, \quad j = 1, 2, \dots, n$$

are less than one in absolute value, then the spectral characteristic has the form (2.1). In this case the coefficients $c_{kj}^{(1)}$, $c_{kj}^{(2)}$, $k = 1, 2, \dots, n$; $j = 1, 2, \dots, l$ may be obtained from the equations (2.14) and (2.15) but the equalities (2.16) and (2.17) do not hold.

THEOREM 2.2. *Let the assumptions be as in Theorem 2.1. If $S < N$, the spectral characteristic $(\Phi_1^Y(\lambda), \dots, \Phi_n^Y(\lambda))$ has the form:*

$$\Phi_1^Y(\lambda) = R_1^{(1)}(\lambda) \sum_{j=0}^l c_{1j}^{(1)} e^{-i\lambda j\theta} + e^{-i\lambda T} R_1^{(2)}(\lambda) \sum_{j=0}^l c_{1j}^{(2)} e^{i\lambda j\theta} + \sum_{\nu \in A} c_\nu^{(3)} e^{i\lambda(\tau+\nu\theta)} \quad (2.18)$$

$$\Phi_k^Y(\lambda) = R_k^{(1)}(\lambda) \sum_{j=0}^l c_{kj}^{(1)} e^{-i\lambda j\theta} + e^{-i\lambda T} R_k^{(2)}(\lambda) \sum_{j=0}^l c_{kj}^{(2)} e^{i\lambda j\theta}, \quad k = 2, \dots, n \quad (2.19)$$

where $A = \{\nu \mid -T < \tau + \nu\theta < 0\}$ and the functions $R_k^{(i)}(\lambda)$ are as in Theorem 2.1.

Proof. In this case we have

$$\begin{aligned} \psi_m^Y(\lambda) &= \sum_{j=-N}^N b^j e^{i\lambda(\tau+j\theta)} f_{1m}^X(\lambda) - \sum_{\nu \in A} c_\nu^{(3)} e^{i\lambda(\tau+\nu\theta)} \sum_{j=-N}^N b^j e^{i\lambda j\theta} f_{1m}^X(\lambda) \\ &\quad - \sum_{k=1}^n \psi_{k,1}(\lambda) f_{km}^X(\lambda) - e^{-i\lambda T} \sum_{k=2}^n \psi_{k,2}(\lambda) f_{km}^X(\lambda) - \sum_{k=1}^n \chi_k(\lambda) f_{km}^X(\lambda) \end{aligned} \quad (2.20)$$

where $\psi_{k,1}(\lambda)$, $\psi_{k,2}(\lambda)$, $\chi_k(\lambda)$, where given by (2.8)—(2.10). We determine the coefficients $c_\nu^{(3)}$, $\nu \in A$, from the condition that the functions $e^{i\lambda(\tau+j\theta)}$, $-T < \tau + j\theta < 0$, are not included in the sum

$$\sum_{j=-N}^N b_j e^{i\lambda(\tau+j\theta)} f_{1m}^X(\lambda) - \sum_{\nu \in A} c_\nu^{(3)} e^{i\lambda(\tau+\nu\theta)} \sum_{j=-N}^N b_j e^{i\lambda j\theta} f_{1m}^X(\lambda).$$

Then, let us represent this sum as $\sum_1 + \sum_2$ where the functions $e^{i\lambda(\tau+j\theta)}$, $\tau + j\theta \geq 0$, are included in \sum_1 and the functions $e^{i\lambda(\tau+j\theta)}$, $\tau + j\theta \leq -T$, are included in \sum_2 . If we define

$$\psi_m^{(1)}(\lambda) = \sum_1 - \sum_{k=1}^n \psi_{k,1}(\lambda) f_{km}^X(\lambda) \quad (2.21)$$

$$\psi_m^{(2)}(\lambda) = e^{i\lambda T} \sum_2 - \sum_{k=1}^n \psi_{k,2}(\lambda) f_{km}^X(\lambda) \quad (2.22)$$

and if we put again $\chi_k(\lambda) = 0$, $k = 1, 2, \dots, n$, the functions $\psi_m(\lambda)$ will have the form (1.10), and the proof is completed as in the previous case.

Remark. The function $\Phi_1^Y(\lambda)$ given by (2.1), is also given by (2.18), where $A = \{\nu \mid -T < \tau + \nu\theta < 0\} = \emptyset$.

COROLLARY. *If $T = l\theta$, we have*

$$\Phi_1^Y(\lambda) = R_1(\lambda) \sum_{j=0}^l c_{1j} e^{-i\lambda j\theta} + \sum_{\nu \in A} k_\nu e^{i\lambda(\tau+\nu\theta)} \quad (2.23)$$

$$\Phi_k^Y(\lambda) = R_k(\lambda) \sum_{j=0}^l c_{kj} e^{-i\lambda j\theta} \quad k = 2, \dots, n. \quad (2.24)$$

This form of the function $(\Phi_1^Y(\lambda), \dots, \Phi_n^Y(\lambda))$ is obtained if $T \rightarrow l\theta$ in (2.18) and (2.19).

THEOREM 2.3. *Let the assumptions be as in Theorem 2.1. Then:*

a) If T/θ is not an integer, we have

$$\begin{aligned} \tilde{Y}_1(t, \tau, T) = \sum_{k=1}^n \left\{ \sum_{j=0}^{m_k-1} \sum_{\nu=0}^l [A_{kj}^{(\nu)} Y_k^{(\nu)}(t-j\theta) + B_{kj}^{(\nu)} Y_k^{(\nu)}(t-T+j\theta)] + \right. \\ \left. + \int_0^T w_k(s) Y_k(t-s) ds \right\} + \sum_{\nu \in A} c_\nu^{(3)} Y_1(t + \tau + \nu\theta) \quad (2.25) \end{aligned}$$

b) If $T = l\theta$, $\tilde{Y}_1(t, \tau, T)$ will have the form

$$\begin{aligned} \tilde{Y}_1(t, \tau, T) = \sum_{k=1}^n \left\{ \sum_{\nu=0}^{m_k-1} \sum_{j=0}^l c_{kj}^{(\nu)} Y_k^{(\nu)}(t-j\theta) + \right. \\ \left. + \int_0^T w_k(s) Y_k(t-s) ds \right\} + \sum_{\nu \in A} k_\nu Y_1(t + \tau + \nu\theta) \quad (2.26) \end{aligned}$$

Proof. a) After separating the polynomials from the rational functions $R_k^{(i)}(\lambda)$, $i = 1, 2$, $k = 1, 2, \dots, n$, the functions $\Phi_k^Y(\lambda)$, $k = 1, \dots, n$, can be represented in the form

$$\Phi_1^Y(\lambda) = \sum_{\nu=0}^{m_1-1} \sum_{j=0}^l \{A_{1j}^{(\nu)} e^{i\lambda(-j\theta)} + B_{1j}^{(\nu)} e^{i\lambda(-T+j\theta)}\} (i\lambda)^\nu + \varphi_1(\lambda) + \sum_{\nu \in A} c_\nu^{(3)} e^{i\lambda(\tau+\nu\theta)} \quad (2.27)$$

$$\Phi_k^Y(\lambda) = \sum_{\nu=0}^{m_k-1} \sum_{j=0}^l \{A_{kj}^{(\nu)} e^{i\lambda(-j\theta)} + B_{kj}^{(\nu)} e^{i\lambda(-T+j\theta)}\} (i\lambda)^\nu + \varphi_k(\lambda), \quad k = 2, \dots, n. \quad (2.28)$$

Then, $\int_{-\infty}^{+\infty} |\varphi_k(\lambda)|^2 d\lambda < \infty$, $k = 1, \dots, n$, and as $|\lambda| \rightarrow \infty$ in the lower halfplane, the functions $\varphi_k(\lambda)$ fall off not slower than $|\lambda|^{-1}$, and as $|\lambda| \rightarrow \infty$ in the upper half-plane, they behave as $|\lambda|^{-k} e^{TIm\lambda}$, $k \geq 1$. We can easily see that the Fourier transform $W_k(s)$ of $\varphi_k(\lambda)$ is equal to zero if $s \in (-\infty, -T] \cup [0, +\infty)$ and consequently we have

$$\varphi_k(\lambda) = \int_0^T e^{-i\lambda s} w_k(s) ds, \quad k = 1, 2, \dots, n \quad (2.29)$$

where $W_k(-s) = 2\pi \cdot w(s)$. The formula (2.25) can be obtained from the equations (1.1), (2.27), (2.28) and (2.29).

3. Extrapolation of autoregressive processes

THEOREM 3.1. *Let $Y(s) = (Y_1(s), \dots, Y_n(s))$ be a nonsingular stationary random process with a rational spectrum, and $X(s)$ the process given by (1.2), where*

the roots of the equation (1.3) are less than one in absolute value. Suppose we know the values $X_k(s)t - T \leq s \leq t$, $k = 1, 2, \dots, n$, and T/θ is not an integer. Denote $[T/\theta] = l$, $[\tau/\theta] = S$. Then, the spectral characteristic $(\Phi_1^X(\lambda), \dots, \Phi_n^X(\lambda))$ for extrapolation of the stationary random process $X(s)$ at the point $t + \tau$, $\tau > 0$ has the following form:

a) If $0 \leq l < N$, then

$$\Phi_1^X(\lambda) = R_1^{(1)}(\lambda) \sum_{j=0}^l c_j^{(1)} e^{-i\lambda j\theta} + e^{-i\lambda T} R_1^{(2)}(\lambda) \sum_{j=0}^l c_j^{(2)} e^{i\lambda j\theta} + \sum_{\nu \in A} c_\nu^{(3)} e^{i\lambda(\tau - \nu\theta)} \quad (3.1)$$

$$\Phi_k^X(\lambda) = R_k^{(1)}(\lambda) \sum_{j=0}^l c_j^{(1)} e^{-i\lambda j\theta} + e^{-i\lambda T} R_k^{(2)}(\lambda) \sum_{j=0}^l c_j^{(2)} e^{i\lambda j\theta}, k = 2, \dots, n. \quad (3.2)$$

b) If $l \geq N$, then

$$\Phi_1^X(\lambda) = R_1^{(1)}(\lambda) \sum_{\nu=0}^N a_\nu e^{-i\lambda\nu\theta} + e^{-i\lambda T} R_1^{(2)}(\lambda) \sum_{\nu=0}^N a_\nu e^{i\lambda\nu\theta} + \sum_{\nu \in B} c_\nu^{(3)} e^{i\lambda(\tau - \nu\theta)} \quad (3.3)$$

$$\Phi_k^X(\lambda) = R_k^{(1)}(\lambda) \sum_{\nu=0}^N a_\nu e^{-i\lambda\nu\theta} + e^{-i\lambda T} R_k^{(2)}(\lambda) \sum_{\nu=0}^N a_\nu e^{i\lambda\nu\theta}, k = 2, \dots, n. \quad (3.4)$$

The functions $R_k^{(i)}(\lambda)$ are rational functions as in Theorem 2.1 and

$$A = \{\nu \mid -T < \tau - \nu\theta < 0\}, \quad B = \{\nu \mid -T < \tau - \nu\theta, \nu \leq N\}.$$

Theorem 3.1 can be proved in the same way as Theorems 2.1 and 2.2 and then we have the following result:

THEOREM 3.2. *Under the assumptions of the Theorem 3.1. we have:*

a) If $0 \leq l < N$, then the linear least-squares estimator $\tilde{X}_1(t, \tau, T)$ of $X_1(t + \tau)$ has the following form

$$\begin{aligned} \tilde{X}_1(t, \tau, T) = & \sum_{k=1}^n \left\{ \sum_{\nu=0}^{m_k-1} \sum_{j=0}^l [A_{kj}^{(\nu)} X_k^{(\nu)}(t - j\theta) + B_{kj}^{(\nu)} X_k^{(\nu)}(t - T + j\theta)] + \right. \\ & \left. + \int_0^T w_k(s) X_k(t - s) ds \right\} + \sum_{\nu \in A} c_\nu^{(3)} X_1(t + \tau - \nu\theta). \quad (3.5) \end{aligned}$$

b) If $l \geq N$, then

$$\begin{aligned} \tilde{X}_1(t, \tau, T) = & \sum_{k=1}^n \left\{ \sum_{\nu=0}^{m_k-1} \sum_{j=0}^l [A_{kj}^{(\nu)} X_k^{(\nu)}(t - j\theta) + B_{kj}^{(\nu)} X_k^{(\nu)}(t - T + j\theta)] + \right. \\ & \left. + \int_0^T w_k(s) X_k(t - s) ds \right\} + \sum_{\nu \in B} c_\nu^{(3)} X_1(t + \tau - \nu\theta). \quad (3.6) \end{aligned}$$

Remark 2: If $m_1 = m_2 = \dots = m = 1$ then the predictor formulae (2.25), (2.26), (3.5) and (3.6) would not involve differentiation.

Example. Let $x_1(t)$ and $x_2(t)$ be two independent stationary random processes with the rational spectral densities $f_1(\lambda) = (\lambda^2 + 1)^{-1}$, $f_2(\lambda) = (\lambda^2 + 4)^{-1}$ and define $X_1(t) = x_1(t) + x_2(t)$, $X_2(t) = x_1(t) - x_2(t)$. Then, $(X_1(t), X_2(t))$ is a stationary random process with the spectral density matrix

$$\begin{bmatrix} (\lambda^2 + 1)^{-1} + (\lambda^2 + 4)^{-1} & (\lambda^2 + 1)^{-1} - (\lambda^2 + 4)^{-1} \\ (\lambda^2 + 1)^{-1} - (\lambda^2 + 4)^{-1} & (\lambda^2 + 1)^{-1} + (\lambda^2 + 4)^{-1} \end{bmatrix}$$

and $D(\lambda) = 4(\lambda^2 + 1)^{-1}(\lambda^2 + 4)^{-1}$, $2L = 0$, $2k = 4$, $m_1 = m_2 = 1$.

Now, let $Y(t)$ be the process given by $Y(t) = X(t) - \beta X(t - 1)$, $|\beta| < 1$, and suppose we know the values of the process $Y(t)$ in the interval $[-1.5, 0]$. If we apply Theorem 2.1. we can find for $\tau > 1$:

$$\begin{aligned} N &= 1, n = 2, l = 1, S > 1, 2L + m_k - 1 = 0 \\ R_1^{(1)}(\lambda) &= K_1, R_1^{(2)}(\lambda) = K_2, R_2^{(1)}(\lambda) = k_1, R_2^{(2)}(\lambda) = k_2 \\ \Phi_1^Y(\lambda) &= K_1(1 + c_{11}^{(1)}e^{-i\lambda}) + e^{-3i\lambda/2}K_2(1 + c_{11}^{(2)}e^{i\lambda}) \\ \Phi_2^Y(\lambda) &= k_1(1 + c_{21}^{(1)}e^{-i\lambda}) + e^{-3i\lambda/2}k_2(1 + c_{21}^{(2)}e^{i\lambda}) \end{aligned}$$

The equalities (2.5) and (2.6) become

$$\begin{aligned} (1 + c_{k_1}^{(1)}e^{-i\lambda})(-\beta e^{-i\lambda} + (1 + \beta^2) - \beta e^{i\lambda}) &= -\beta c_{k_1}^{(1)}e^{-2i\lambda} + \\ &+ (-\beta + (1 + \beta^2)c_{k_1}^{(1)})e^{-i\lambda} + (1 + \beta^2 - \beta c_{k_1}^{(1)}) - \beta e^{-i\lambda} \\ (1 + c_{k_1}^{(2)}e^{i\lambda})(-\beta e^{-i\lambda} + 1 + \beta^2 - \beta e^{i\lambda}) &= -\beta e^{-i\lambda} + \\ &+ (1 + \beta^2 - \beta c_{k_1}^{(2)}) + (-\beta + (1 + \beta^2)c_{k_1}^{(2)})e^{i\lambda} - \beta c_{k_1}^{(2)}e^{2i\lambda}. \end{aligned}$$

From the equations (2.14) and (2.15) we can find

$$c_{11}^{(1)} = c_{21}^{(1)} - \frac{\beta^2}{1 + \beta^2}, \quad c_{11}^{(2)} = c_{21}^{(2)} = \frac{\beta}{1 + \beta^2}$$

and consequently

$$\begin{aligned} \Phi_1^Y(\lambda) &= K_1 \left(1 + \frac{\beta}{1 + \beta^2} e^{-i\lambda} \right) + e^{-3i\lambda/2} K_2 \left(1 + \frac{\beta}{1 + \beta^2} e^{i\lambda} \right) \\ \Phi_2^Y(\lambda) &= k_1 \left(1 + \frac{\beta}{1 + \beta^2} e^{-i\lambda} \right) + e^{-3i\lambda/2} k_2 \left(1 + \frac{\beta}{1 + \beta^2} e^{i\lambda} \right) \end{aligned}$$

$$\begin{aligned}
\psi_1^{(1)}(\lambda) &= \{-\beta e^{i\lambda(\tau-1)} + (1+\beta^2)e^{i\lambda\tau} - \beta e^{i\lambda(\tau+1)}\} \{(\lambda^2+1)^{-2} + (\lambda^2+4)^{-1}\} \\
&\quad - \left\{ K_1 \left(1 + \beta^2 - \frac{\beta^2}{1+\beta^2} - \beta e^{i\lambda} \right) - K_2 \frac{\beta^2}{1+\beta^2} e^{i\lambda/2} \right\} \{(\lambda^2+1)^{-1} + (\lambda^2+4)^{-1}\} \\
&\quad - \left\{ k_1 \left(1 + \beta^2 - \frac{\beta^2}{1+\beta^2} - \beta e^{i\lambda} \right) - k_2 \frac{\beta^2}{1+\beta^2} e^{i\lambda/2} \right\} \{(\lambda^2+1)^{-1} - (\lambda^2+4)^{-1}\} \\
\psi_2^{(1)}(\lambda) &= \{-\beta e^{i\lambda(\tau-1)} + (1+\beta^2)e^{i\lambda\tau} - \beta e^{i\lambda(\tau+1)}\} \{(\lambda^2+1)^{-1} - (\lambda^2+4)^{-1}\} \\
&\quad - \left\{ K_1 \left(1 + \beta^2 - \frac{\beta^2}{1+\beta^2} - \beta e^{i\lambda} \right) - K_2 \frac{\beta^2}{1+\beta^2} e^{i\lambda/2} \right\} \{(\lambda^2+1)^{-1} - (\lambda^2+4)^{-1}\} \\
&\quad - \left\{ k_1 \left(1 + \beta^2 - \frac{\beta^2}{1+\beta^2} - \beta e^{i\lambda} \right) - k_2 \frac{\beta^2}{1+\beta^2} e^{i\lambda/2} \right\} \{(\lambda^2+1)^{-1} + (\lambda^2+4)^{-1}\} \\
\psi_1^{(2)}(\lambda) &= \left\{ -K_1 \frac{\beta^2}{1+\beta^2} e^{-i\lambda/2} + K_2 \left(1 + \beta^2 - \frac{\beta^2}{1+\beta^2} - \beta e^{-i\lambda} \right) \right\} \{(\lambda^2+1)^{-1} + (\lambda^2+4)^{-1}\} \\
&\quad + \left\{ -k_1 \frac{\beta^2}{1+\beta^2} e^{-i\lambda/2} + k_2 \left(1 + \beta^2 - \frac{\beta^2}{1+\beta^2} - \beta e^{-i\lambda} \right) \right\} \{(\lambda^2+1)^{-1} - (\lambda^2+4)^{-1}\} \\
\psi_2^{(2)}(\lambda) &= \left\{ -K_1 \frac{\beta^2}{1+\beta^2} e^{-i\lambda/2} + K_2 \left(1 + \beta^2 - \frac{\beta^2}{1+\beta^2} - \beta e^{-i\lambda} \right) \right\} \{(\lambda^2+1)^{-1} - (\lambda^2+4)^{-1}\} \\
&\quad + \left\{ -k_1 \frac{\beta^2}{1+\beta^2} e^{-i\lambda/2} + k_2 \left(1 + \beta^2 - \frac{\beta^2}{1+\beta^2} - \beta e^{-i\lambda} \right) \right\} \{(\lambda^2+1)^{-1} + (\lambda^2+4)^{-1}\}
\end{aligned}$$

If we define $B_k^{(j)}(\lambda) = (\lambda^2+1)(\lambda^2+4)\psi_k^{(j)}$, $k; j = 1, 2$, then the constants K_1, K_2, k_1, k_2 can be found from the equations

$$\begin{aligned}
B_1^{(1)}(i) \equiv B_2^{(1)}(i) &= 0, \quad B_1^{(1)}(2i) \equiv -B_2^{(1)}(2i) = 0 \\
B_1^{(2)}(-i) \equiv B_2^{(2)}(-i) &= 0, \quad B_1^{(2)}(-2i) \equiv -B_2^{(2)}(-2i) = 0
\end{aligned}$$

Then,

$$\begin{aligned}
\tilde{Y}_1\left(0, \frac{3}{2}, \tau\right) &= K_1 Y_1(0) + \frac{\beta}{1+\beta^2} K_1 Y_1(-1) + K^2 Y_1\left(-\frac{3}{2}\right) + \frac{\beta}{1+\beta^2} K_2 Y_1\left(-\frac{1}{2}\right) \\
&\quad + k_1 Y_2(0) + \frac{\beta}{1+\beta^2} k_1 Y_2(-1) + k_2 Y_2\left(-\frac{3}{2}\right) + \frac{\beta}{1+\beta^2} k_2 Y_2\left(-\frac{1}{2}\right).
\end{aligned}$$
